Why fast single photon detection?

Multianode PMTs

MCP PMTs

HPDs, HAPDs

SiPMs

Summary

Parameters of photosensors

Photon detection efficiency (PDE)

- quantum efficiency
- collection efficiency / Geiger discharge probability

Granularity

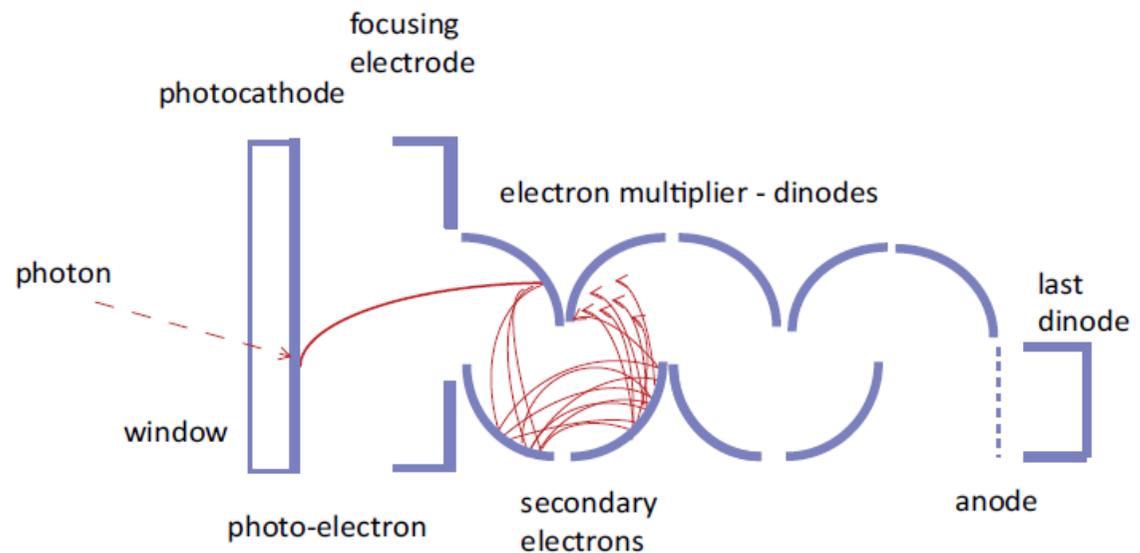

Time resolution (transient time spread – TTS)

Long term stability

Operation in magnetic field

Dark count rate

+ ...

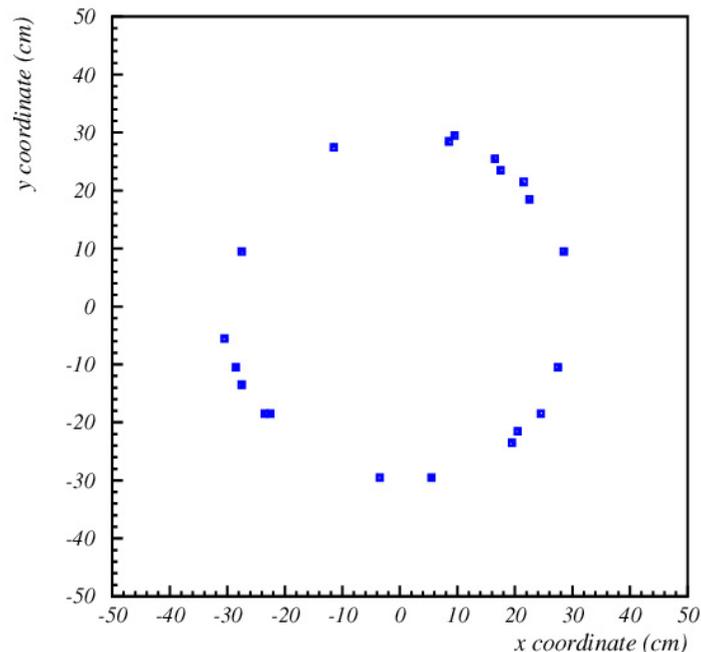

Photon detection in RICH counters

RICH counter: measure photon impact point on the photon detector surface

→ detection of **single** photons with

- sufficient **spatial resolution**
- **high efficiency** and **good signal-to-noise ratio**
- over a **large area** (square meters)

Special requirements:

- **Operation in magnetic field**
- **High rate capability**
- **Very high spatial resolution**
- **Excellent timing (time-of-arrival information)**

Fast photon detection

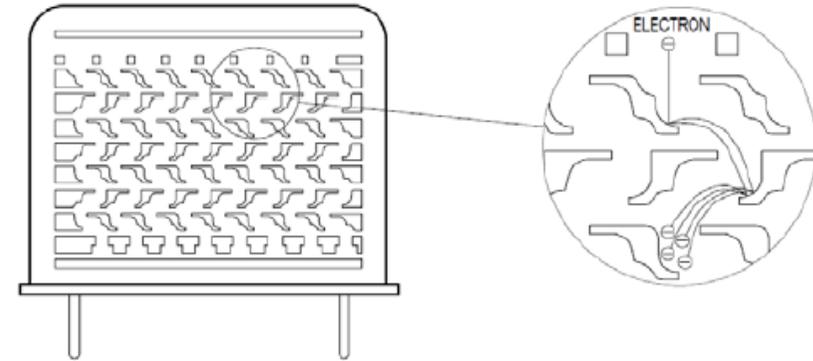

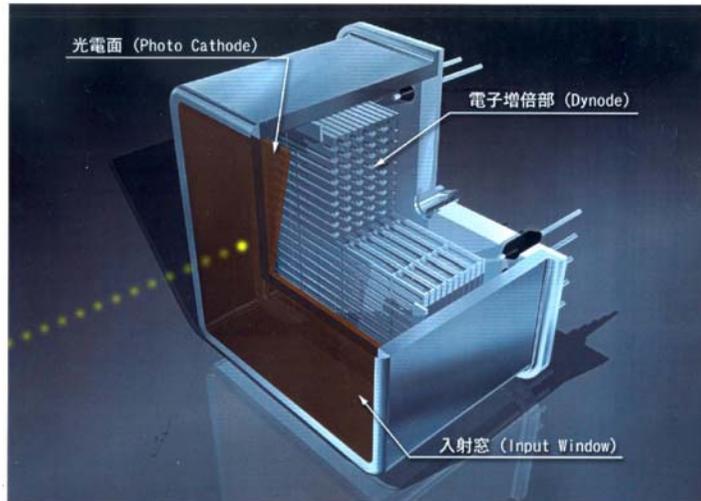

New generation of RICH counters: precise time information needed to further improve performance:

- Reduce chromatic aberration (group velocity): Focusing DIRC
- Combine TOF and RICH techniques: TOP (Time-of-propagation counter), TORCH

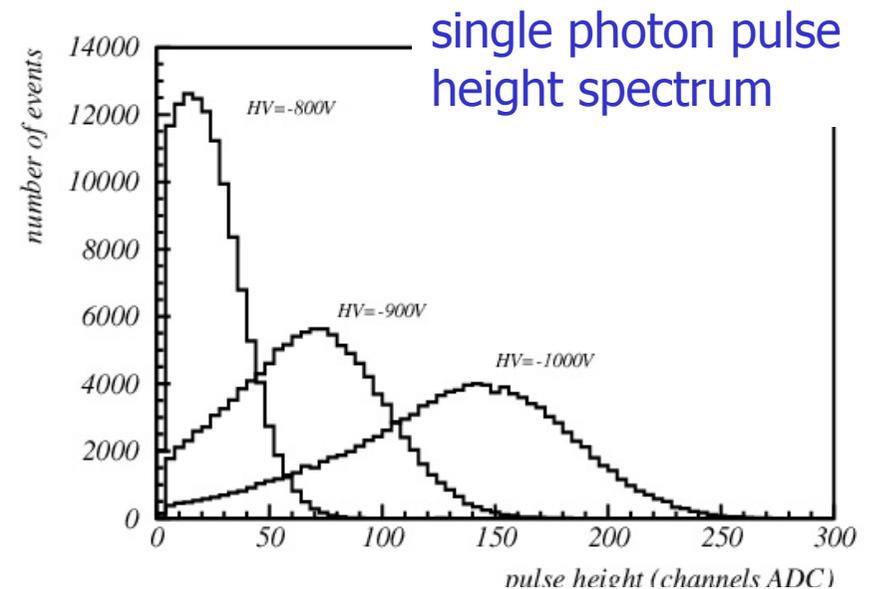

→ Need photo sensors with excellent timing

First fast multianode sensor for single photons: MA PMT

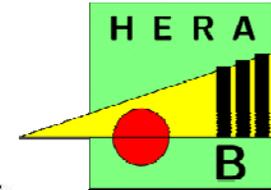

Multianode PMT Hamamatsu R5900 with metal foil dynodes

- Excellent single photon pulse height spectrum
- Low noise (few Hz/ch)
- Low cross-talk (<1%)

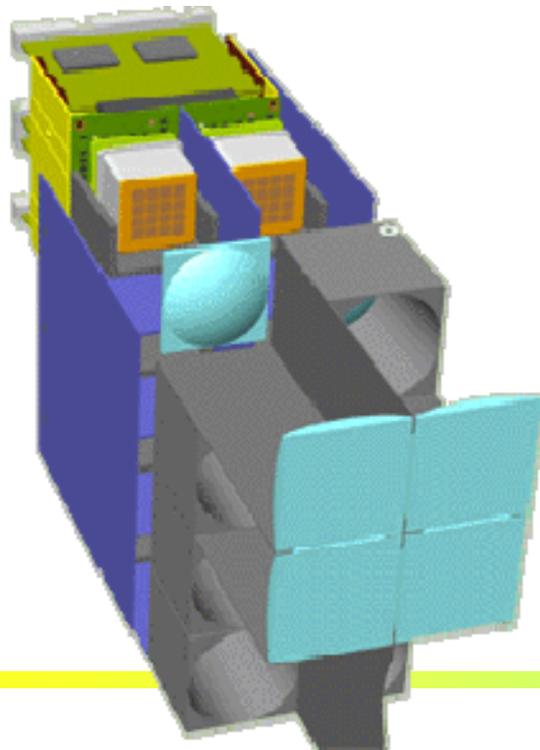

First major application: HERA-B RICH

Light collection system
(imaging!) to:

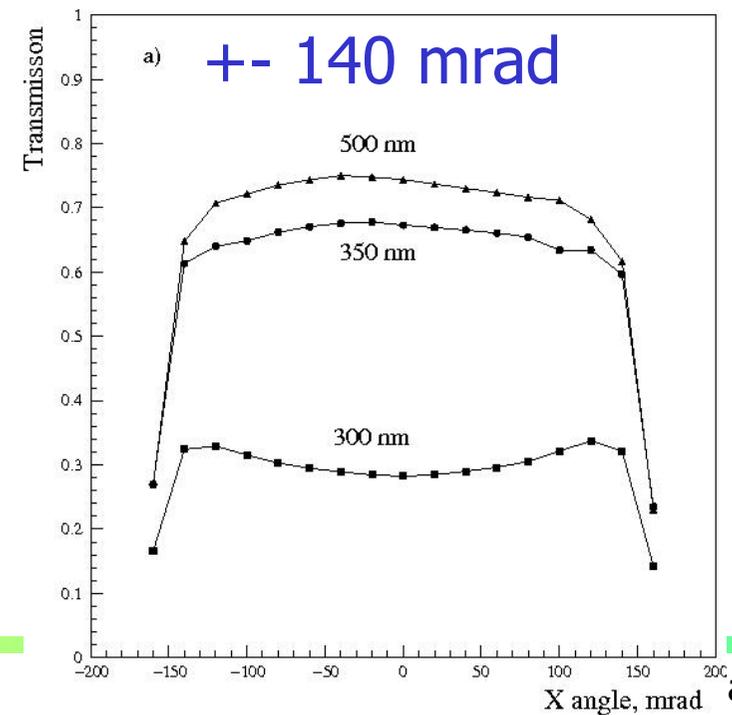

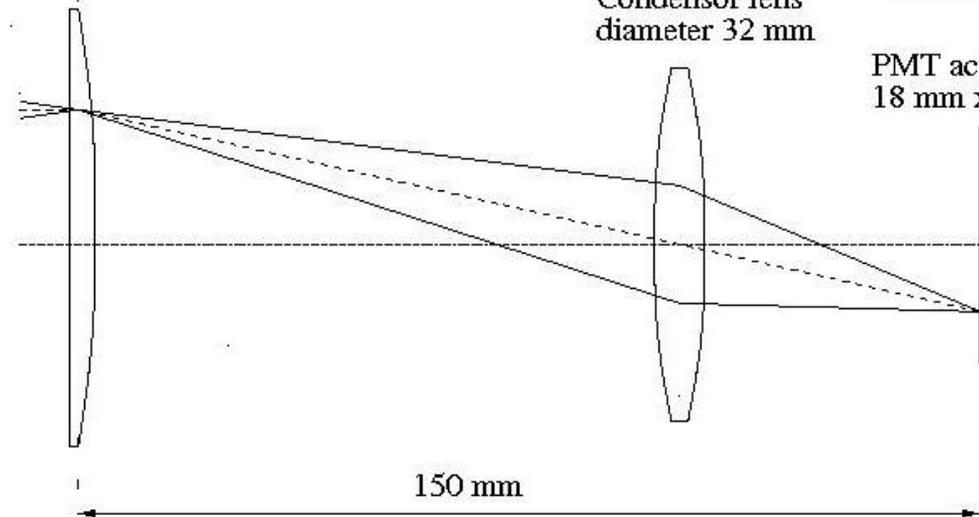

- Eliminate dead areas
- Adapt the pad size

Field lens, 35 mm x 35 mm

Condenser lens
diameter 32 mm

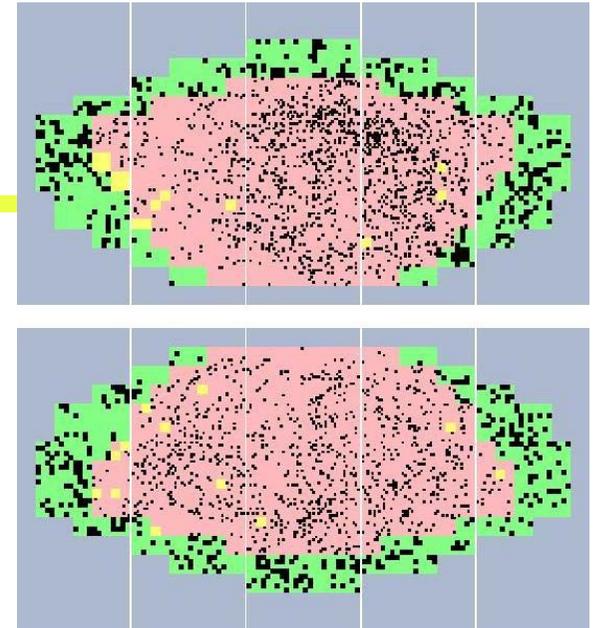

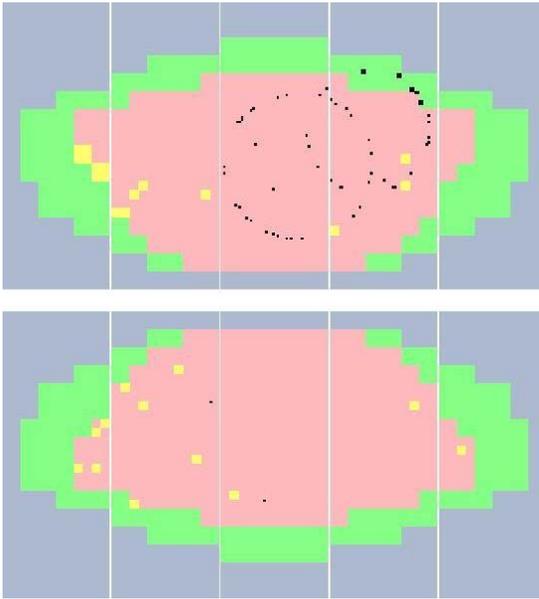

PMT active area
18 mm x 18 mm

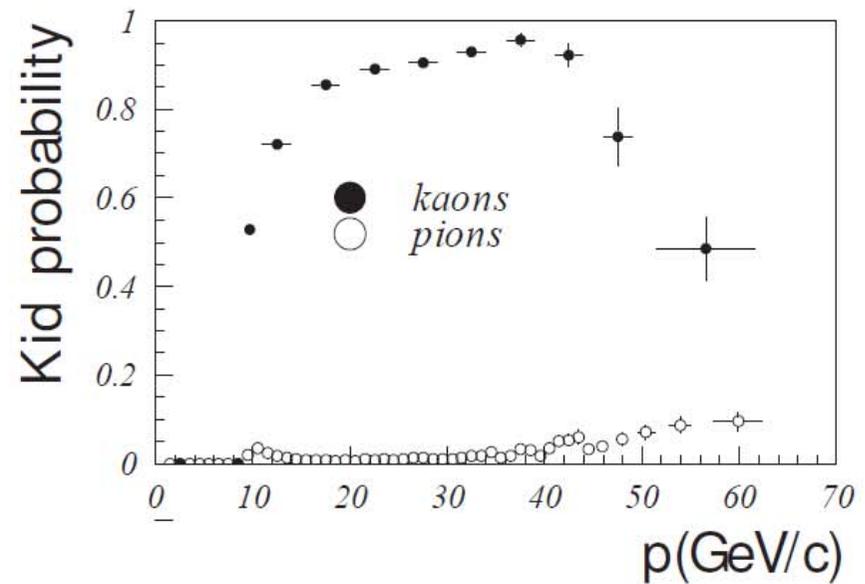

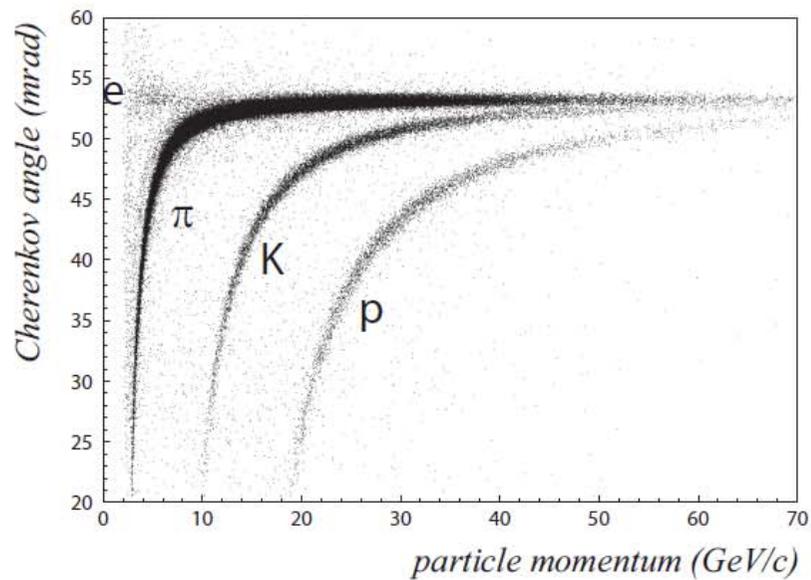

HERA-B RICH

← Little noise, ~ 30 photons per ring

Typical event

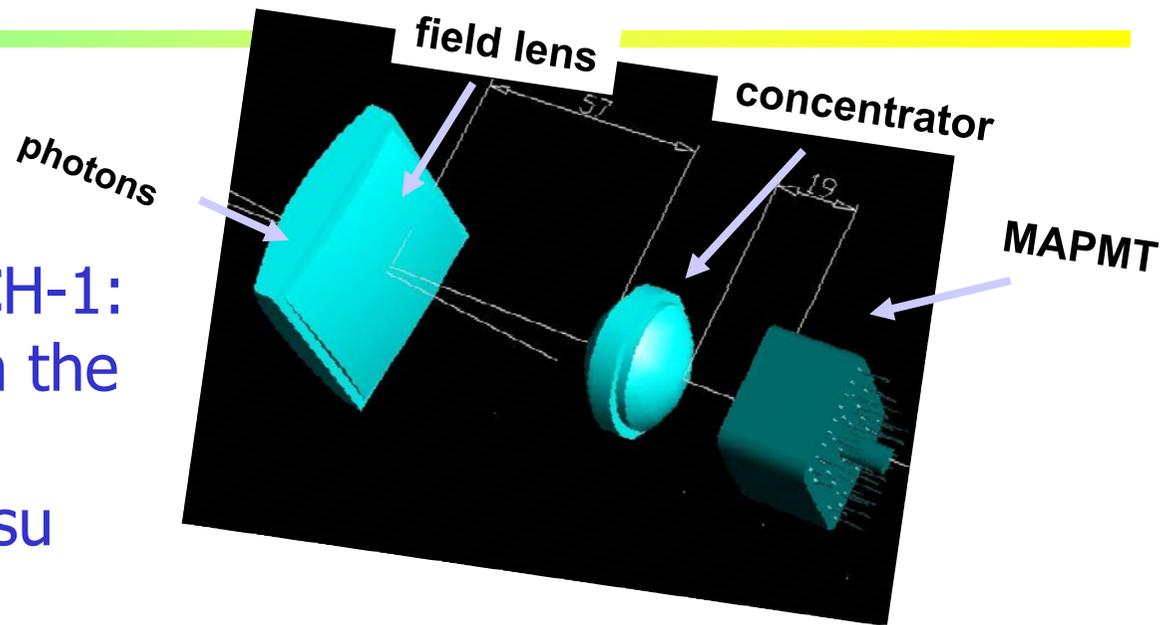

Very good performance:

Kaon efficiency and pion fake probability

Photon detector for the COMPASS RICH-1

Upgraded COMPASS RICH-1:
similar concept as in the
HERA-B RICH, lens
system + Hamamatsu
MAPMTs

New features:

- UV extended PMTs & lenses (down to 200 nm)
- surface ratio = (telescope entrance surface) / (photocathode surface) = 7
- fast electronics with <120 ps time resolution

COMPASS RICH-1 upgrade

Performance:

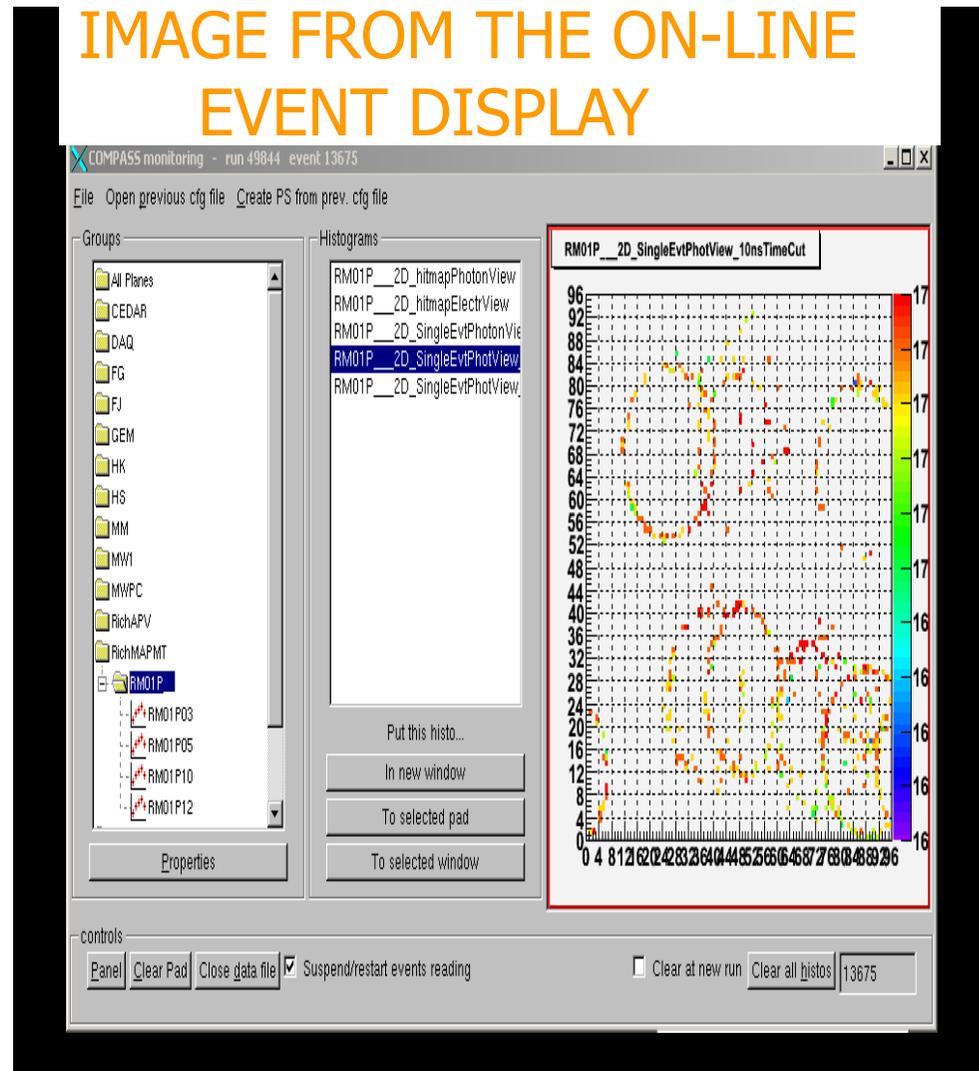

~ 60 detected photons per ring at saturation ($\beta = 1$) $\rightarrow N_0 \sim 66 \text{ cm}^{-1}$

$\sigma_\theta \sim 0.3 \text{ mrad} \rightarrow 2 \sigma \pi\text{-K}$ separation at $\sim 60 \text{ GeV/c}$

K-ID efficiency (K^\pm from Φ decay) $> 90\%$

$\pi \rightarrow K$ misidentification (π^\pm from K_s decay) $\sim 1\%$

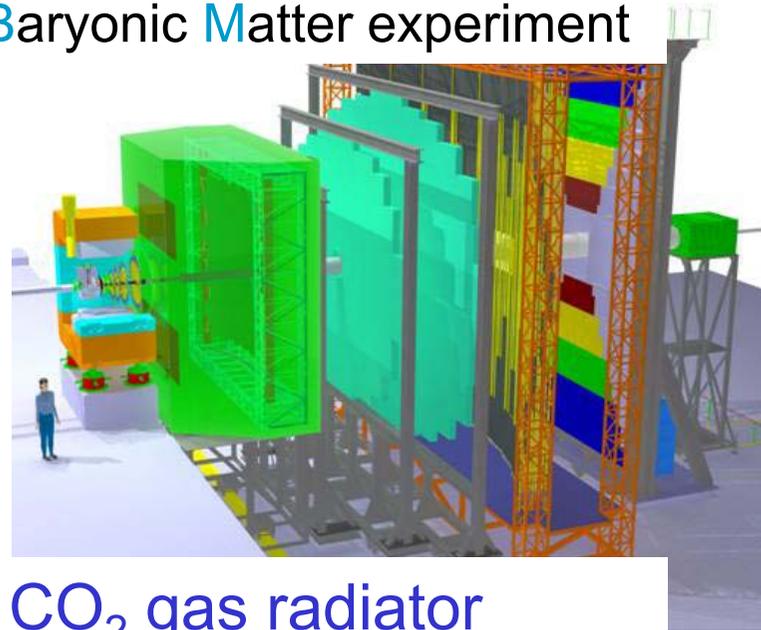

IMAGE FROM THE ON-LINE EVENT DISPLAY

RICH for CBM at FAIR (GSI)

Compressed Baryonic Matter experiment

RICH: electron ID (= strong π suppression) and hadron ID

- 2.25 m long CO₂ gas radiator
- photon detector: 2 MA PMT planes
- need sensitivity down to 180nm

One of the sensor candidates: a recent version of the R5900

Hamamatsu R11265-103-M16:
78% effective coverage
SBA cathode, 35% max q.e.

Flat pannel multianode PMTs

Problem: active area fraction

One possible solution: make a larger sensor

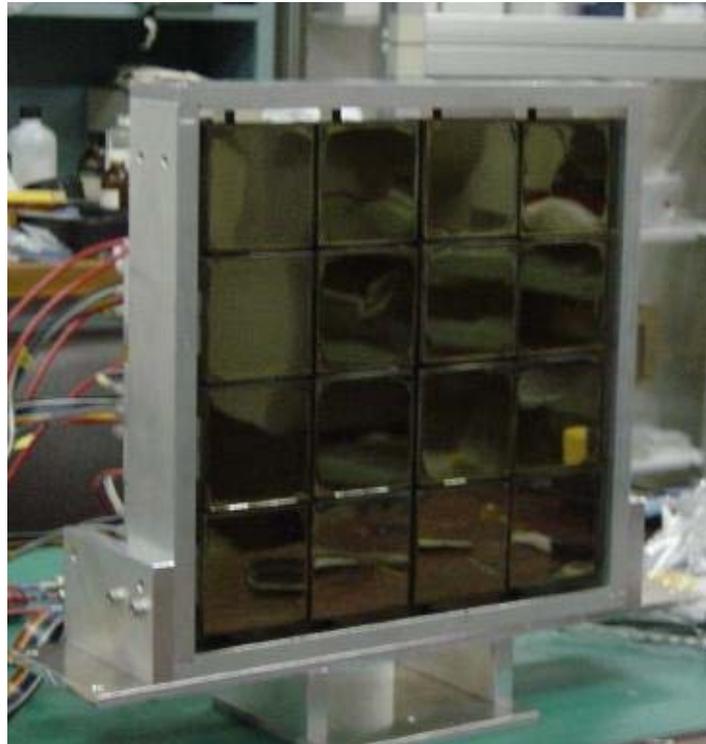

Hamamatsu: flat pannel PMT H8500

- 52 x 52mm², 89% effective coverage
- 64 channels, pixel size 5.8 x 5.8 mm²
- 12 dynodes, metal foil type
- Bialkali cathode, max 25% quantum efficiency
- single photon pulse height distribution not as good as in the smaller R5900 (and related tubes like 7600)

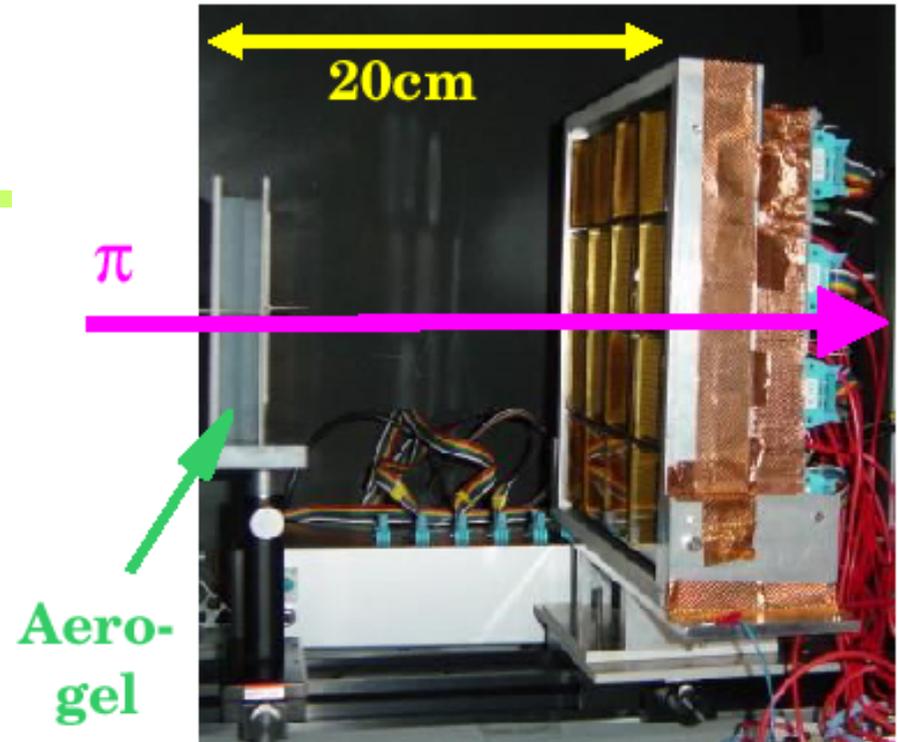

Flat pannel MA PMTs

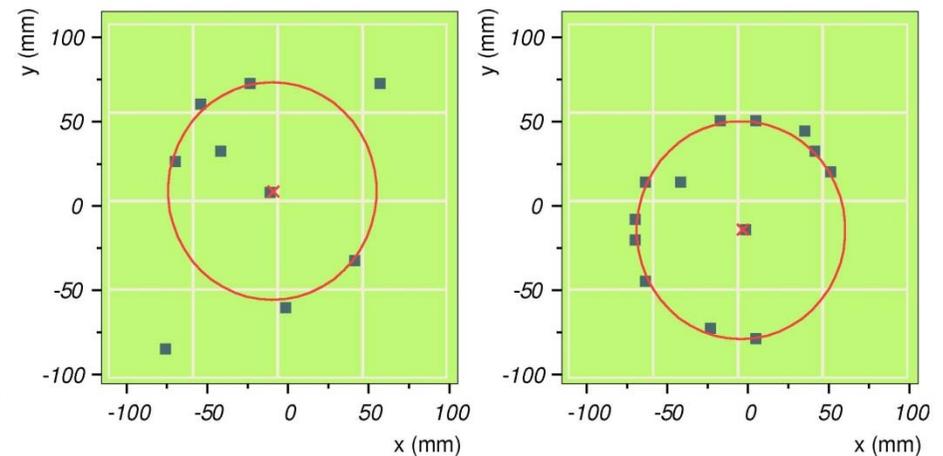

First used in a prototype RICH for Belle II, with aerogel radiator.

array of 16 H8500 PMTs

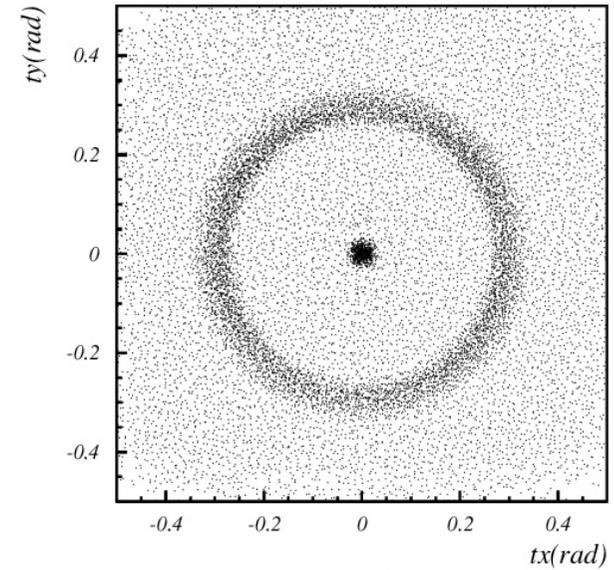

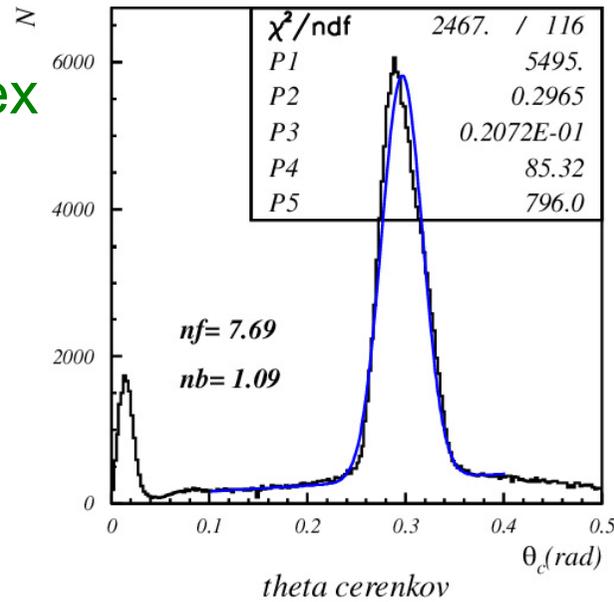

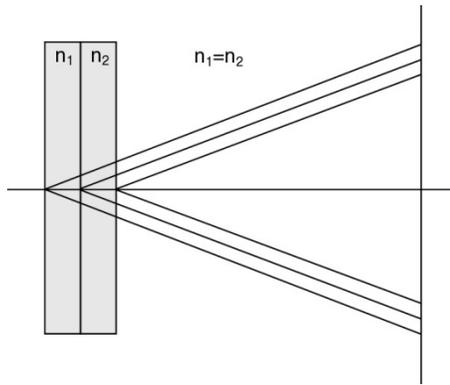

Clear rings, little background

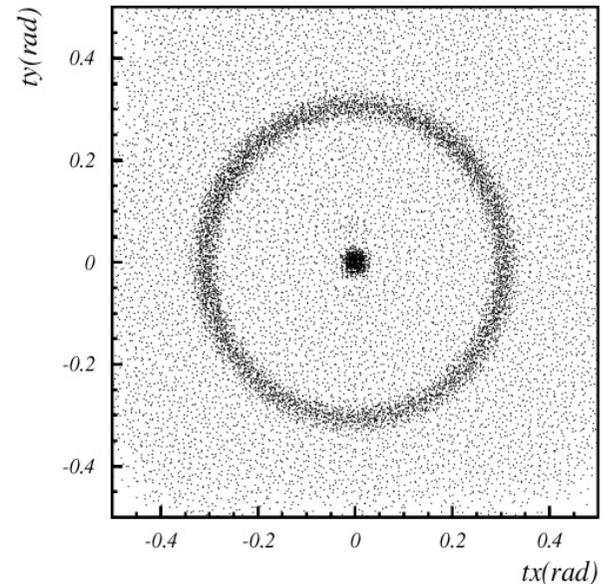

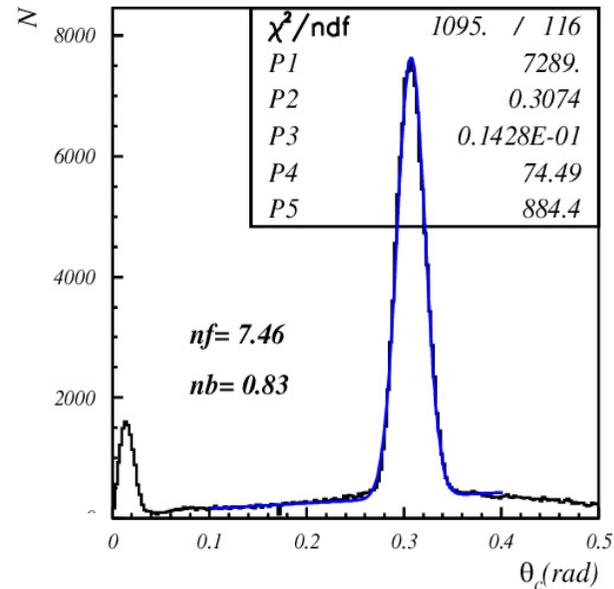

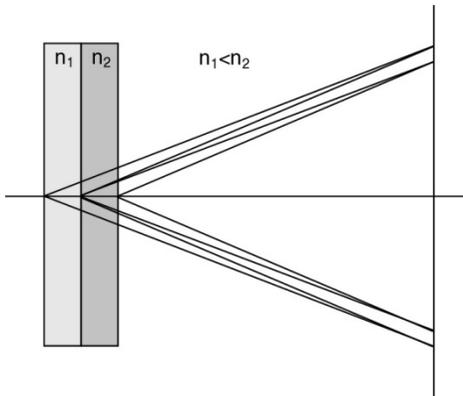

Used for the proof-of-principle test of the focusing radiator configuration

4cm aerogel single index

ring in cerenkov space

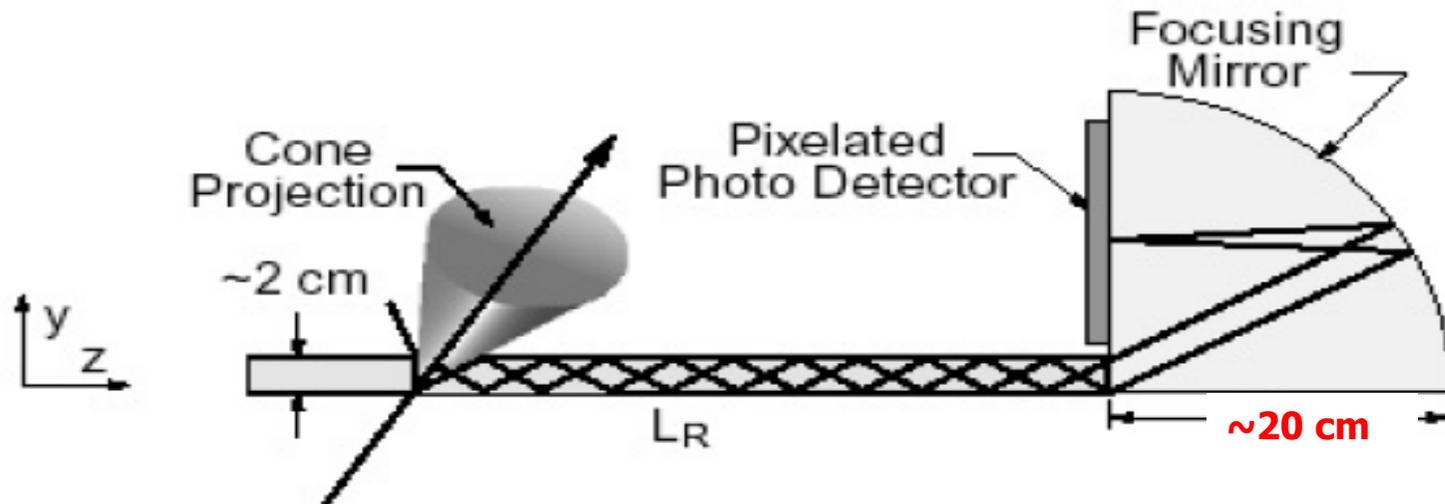

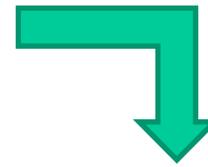

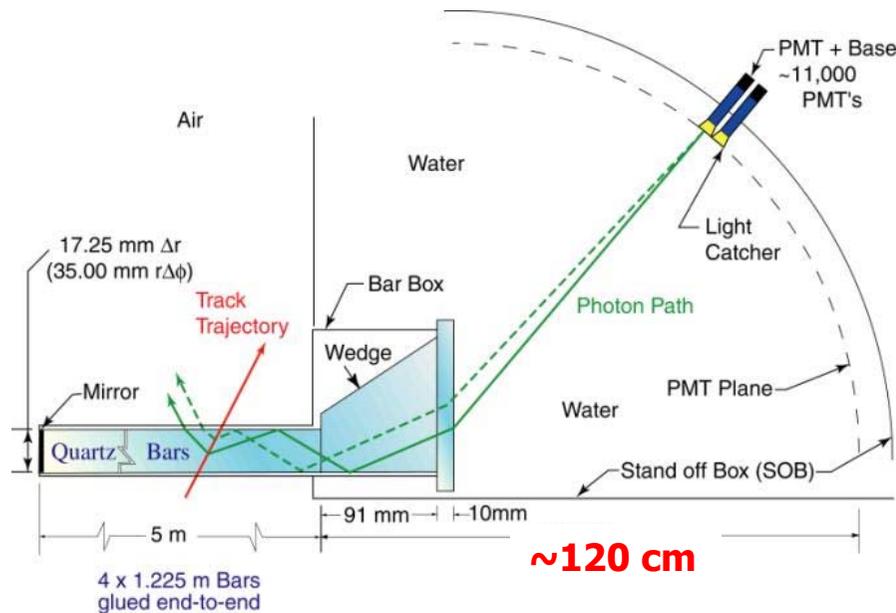

2+2cm aerogel

→ NIM A548 (2005) 383

Flat pannel MA PMTs: Focusing DIRC

Next step in the DIRC development, remove the stand-off box →

Focusing DIRC

Super-B factory: 100x higher luminosity => DIRC needs to be smaller and faster

Focusing and smaller pixels can reduce the expansion volume by a factor of 7-10 !

Timing resolution improvement: $\sigma \sim 1.7\text{ns}$ (BaBar DIRC)

→ $\sigma \leq 150\text{-}200\text{ps}$ ($\sim 10\text{x}$ better) allows a measurement of the photon group velocity $c_g(\lambda)$ to correct the chromatic error of θ_c .

Photon detector requirements:

- Pad size $< 5\text{mm}$
- Time resolution $\sim 50\text{-}100\text{ps}$

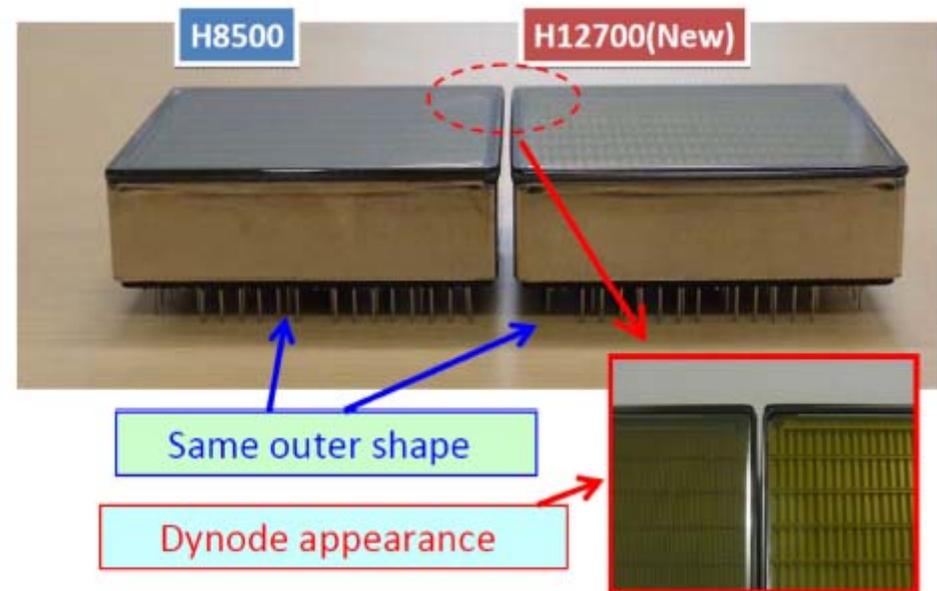

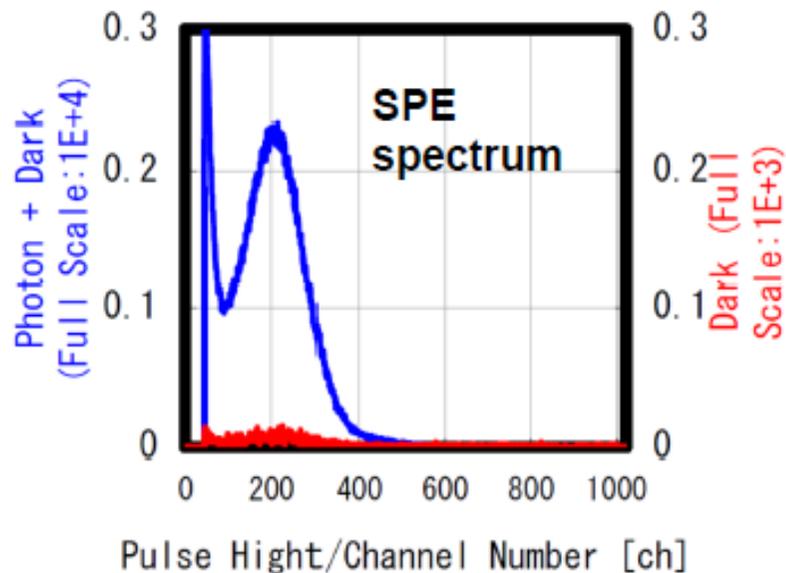

One of the two options: Hamamatsu flat panel PMTs.

Flat pannel MA PMTs: CBM RICH

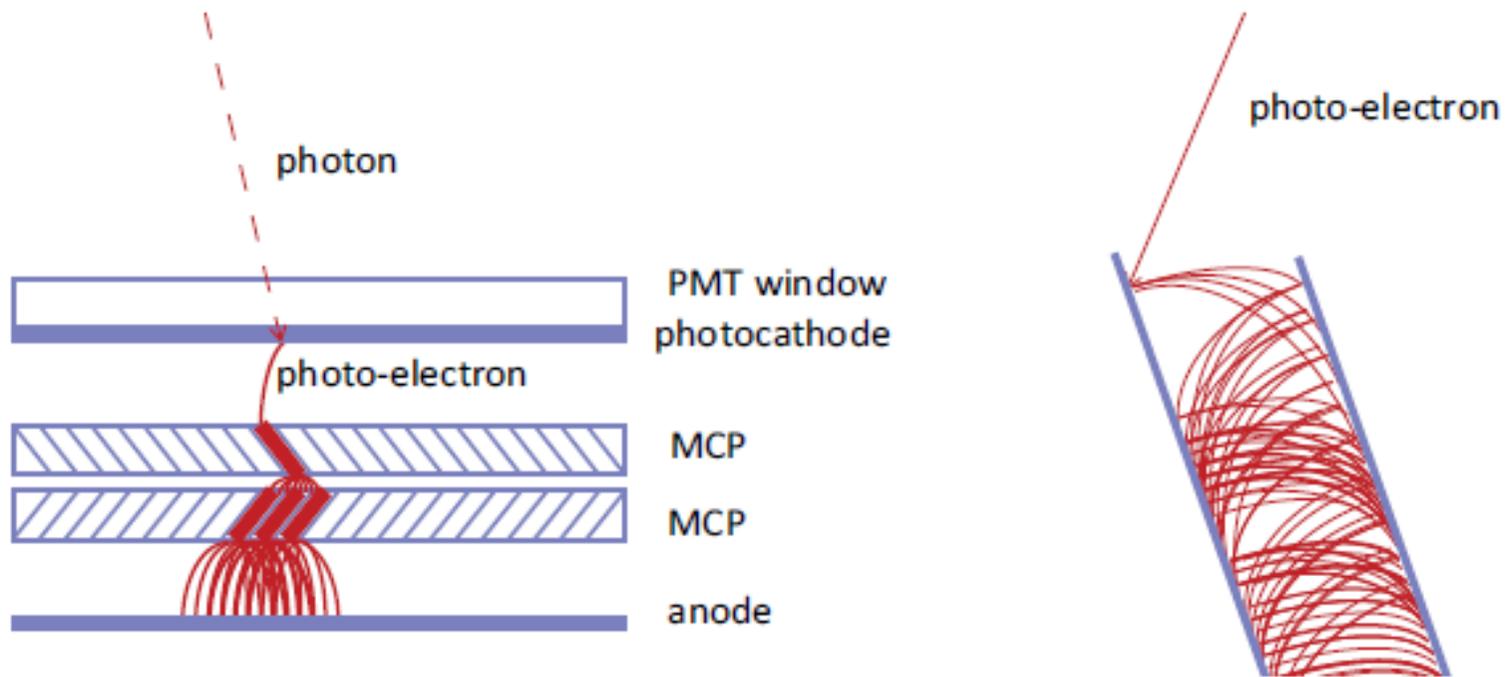

Baseline option for the CBM RICH

News: a novel version of H8500 available, with a considerably better single photon pulse height distribution

Same sensor also considered for the CLASS12 RICH

Micro-channel plate PMTs

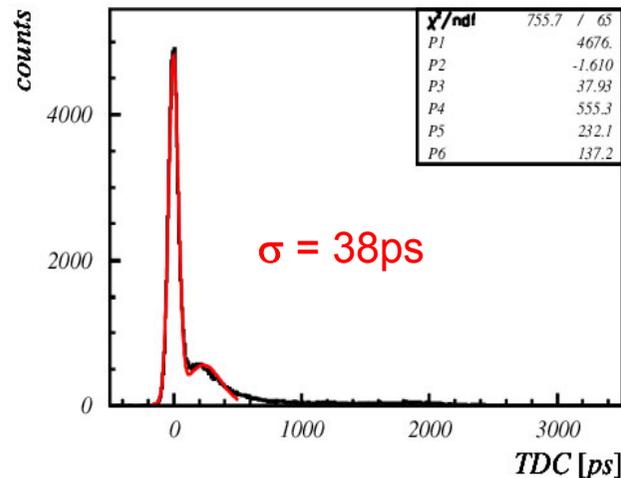

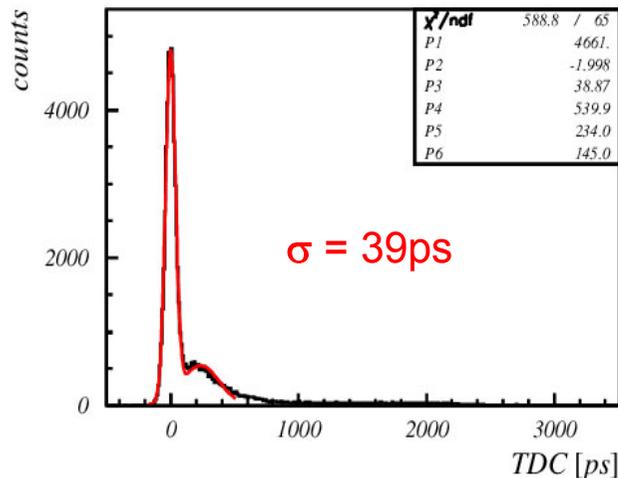

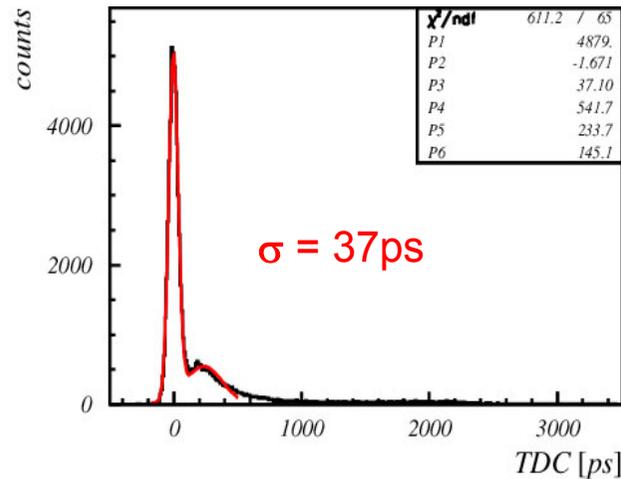

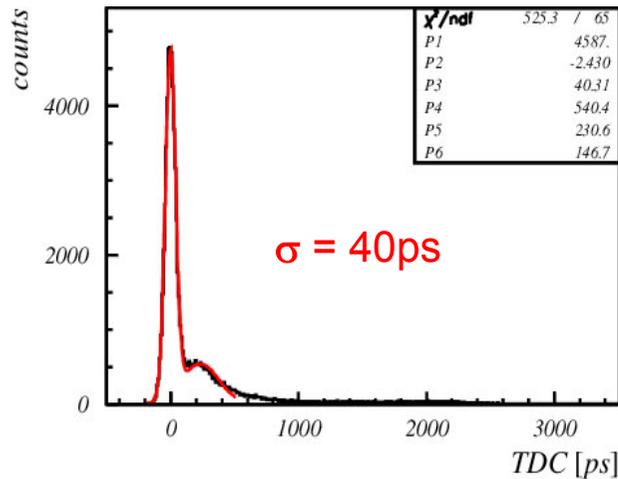

- Fast
- Immune to an axial magnetic field

BURLE/Photonis MCP-PMT

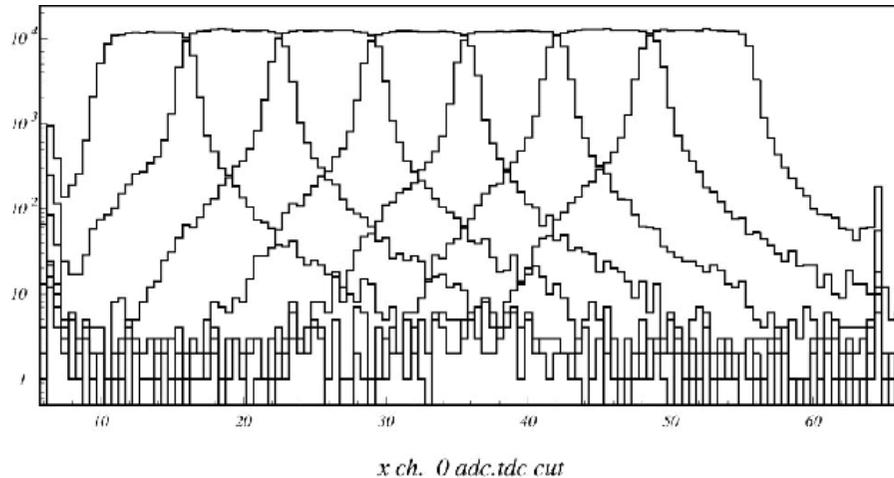

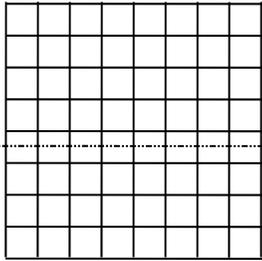

BURLE 85011 microchannel plate (MCP) PMT: time resolution after time walk correction

Tails understood, can be significantly reduced by:

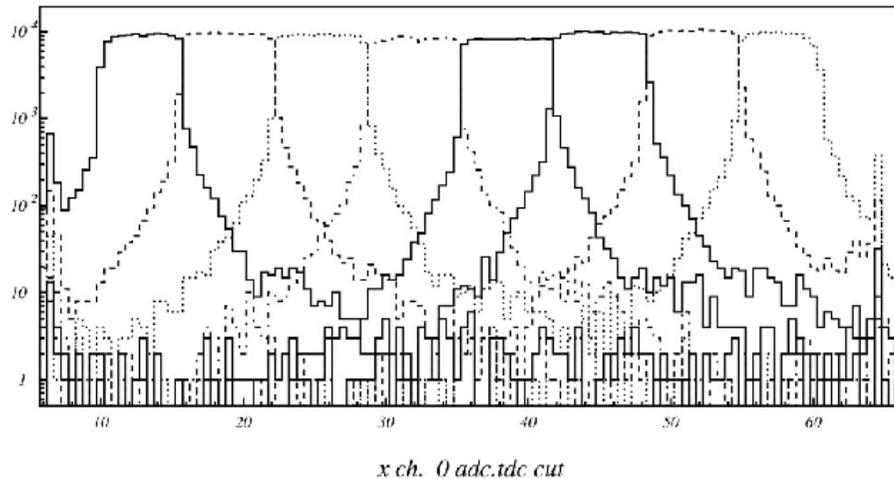

- decreased photocathode-MCP distance and
- increased voltage difference

MCP PMT: sensitivity to magnetic field

Number of detected hits on individual channels as a function of light spot position.

$B = 0 \text{ T},$
 $HV = 2400 \text{ V}$

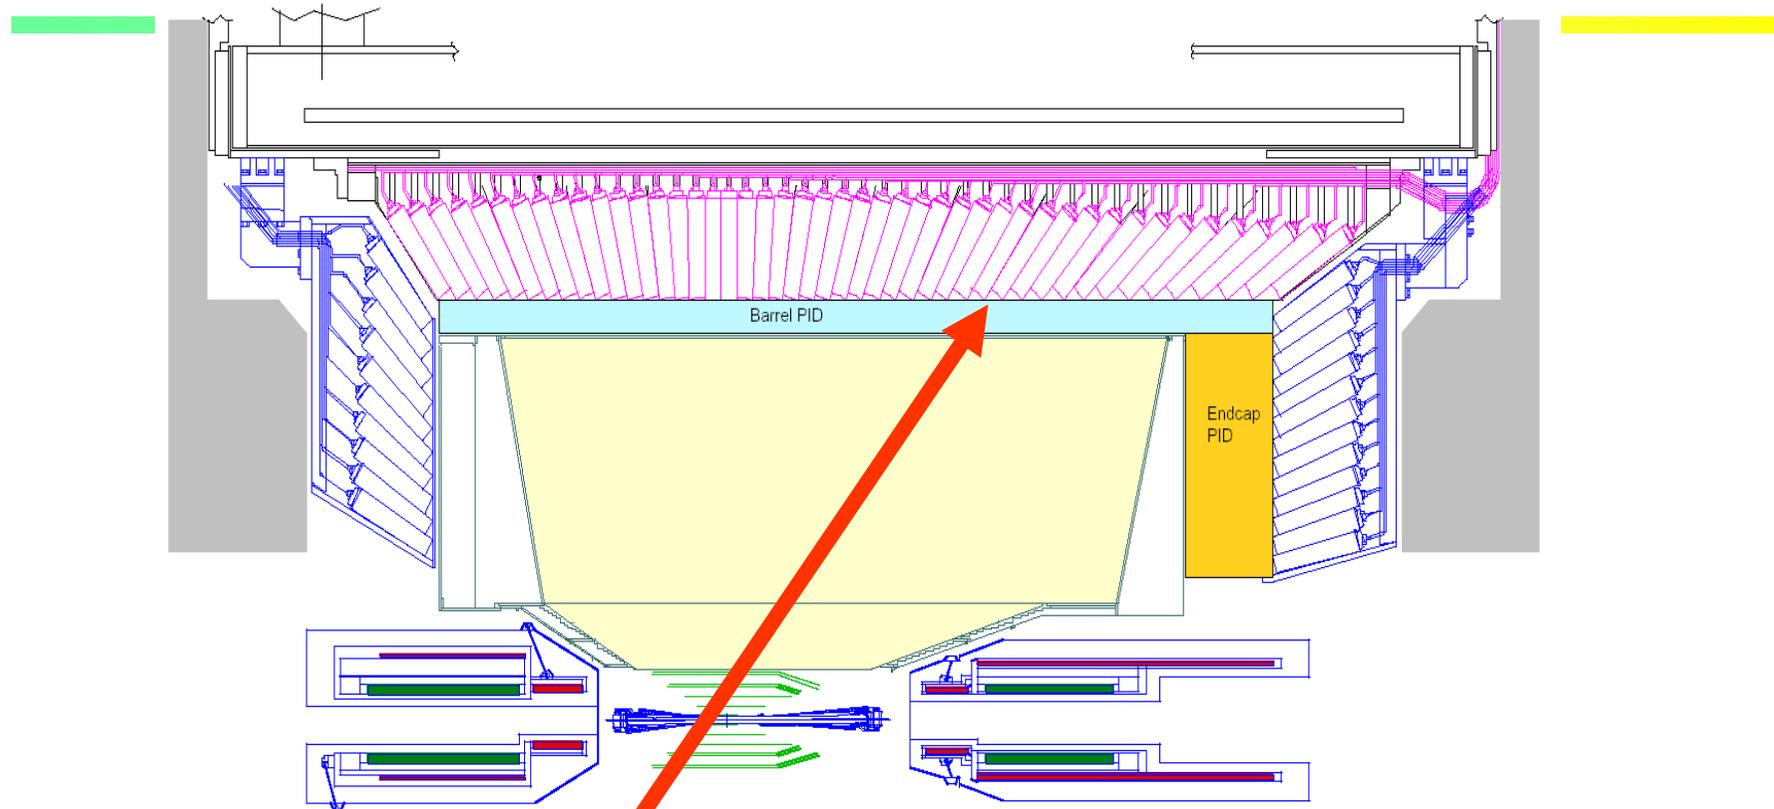

$B = 1.5 \text{ T},$
 $HV = 2500 \text{ V}$

In the presence of magnetic field, charge sharing and cross talk due to long range photoelectron back-scattering are considerably reduced.

Belle upgrade – side view

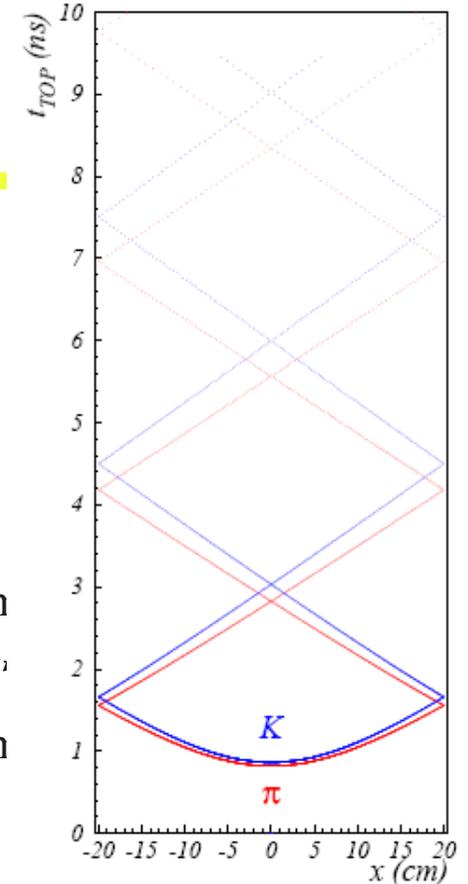

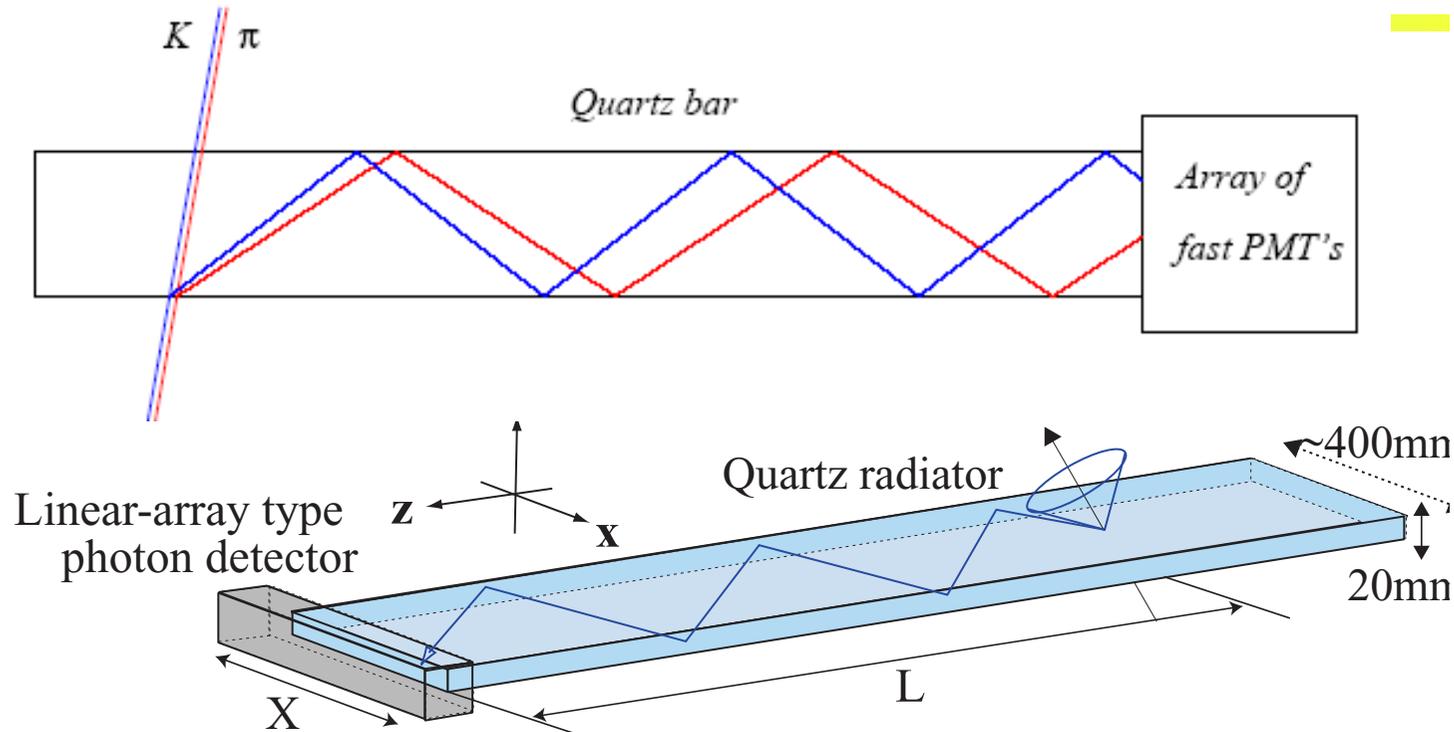

Two new particle ID devices, both RICHes:

Barrel: Time-of-propagation counter (TOP) counter

Endcap: proximity focusing RICH

Time-Of-Propagation (TOP) counter

Similar to DIRC, but instead of two coordinates measure:

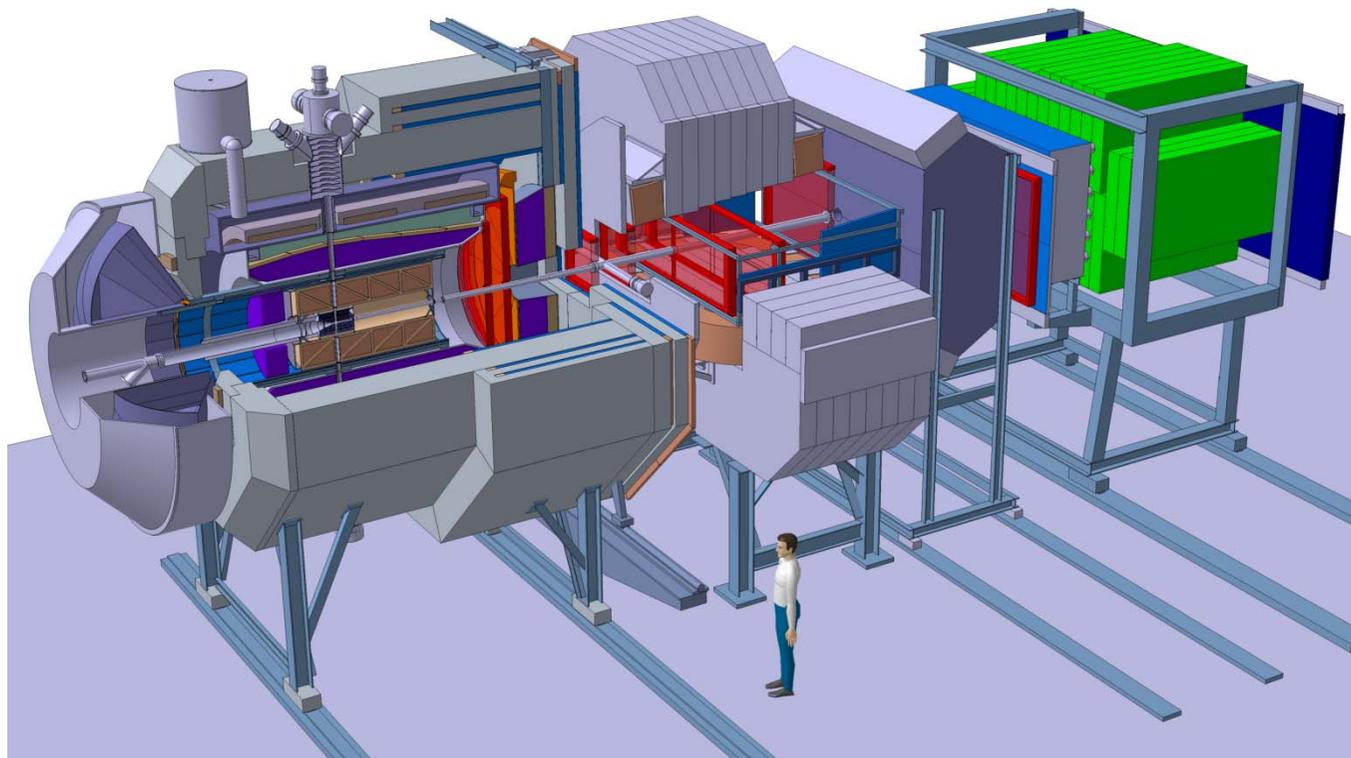

- One (or two coordinates) with a few mm precision
- Time-of-arrival
- Excellent time resolution $< \sim 40\text{ps}$ required for single photons in 1.5T B field

Hamamatsu
SL10 MCP-PMT

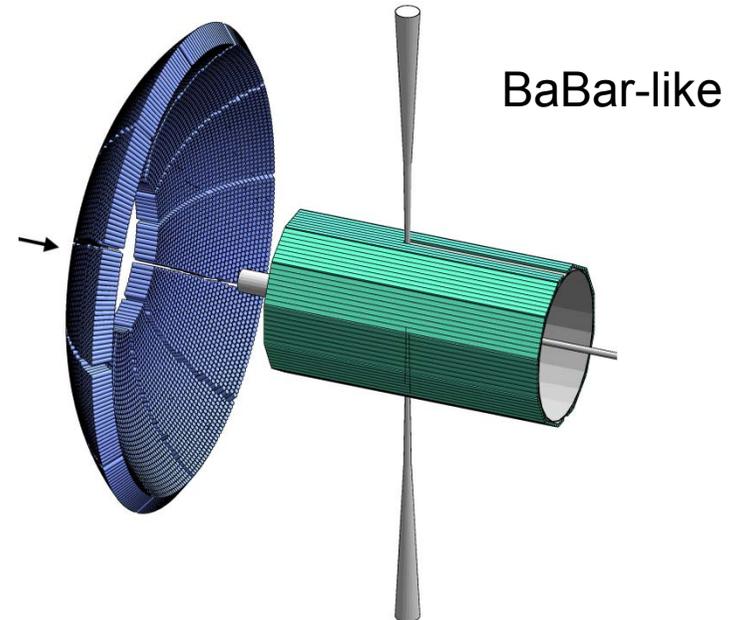

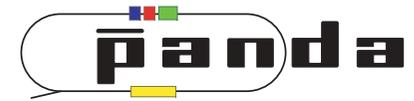

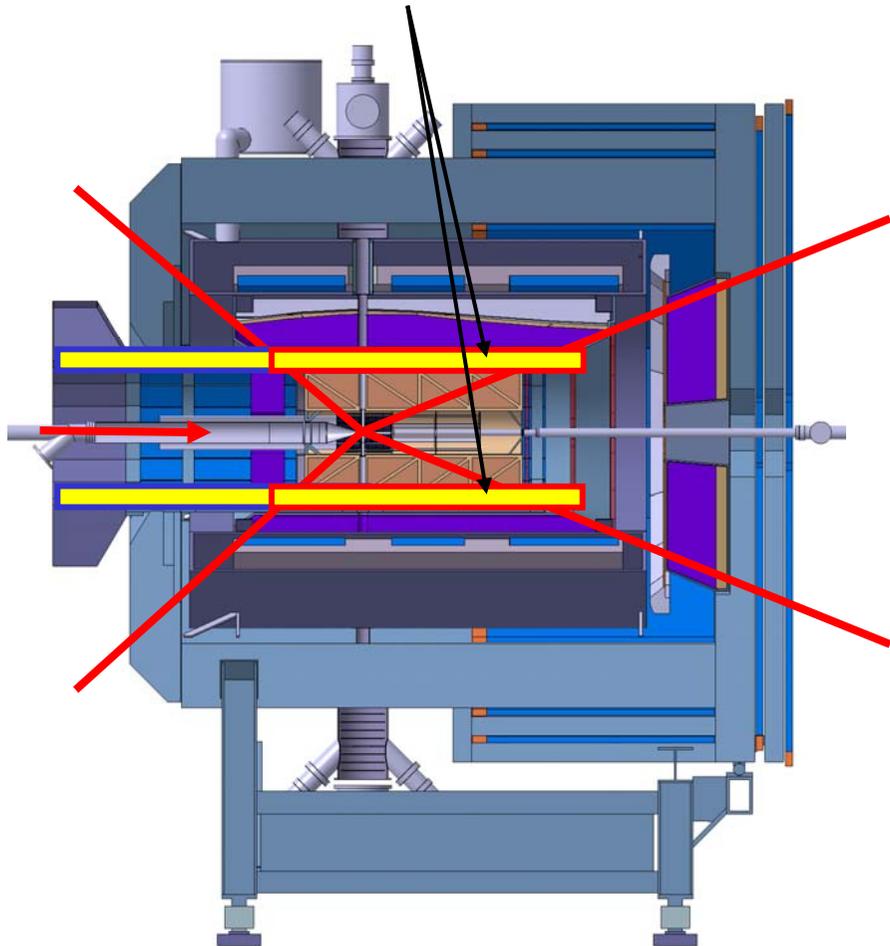

DIRC counters for PANDA (FAIR, GSI)

Two DIRC-like counters are considered for the PANDA experiment

PANDA barrel DIRC

Barrel-DIRC

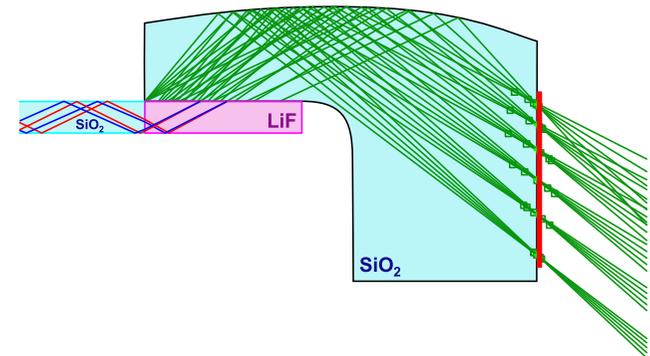

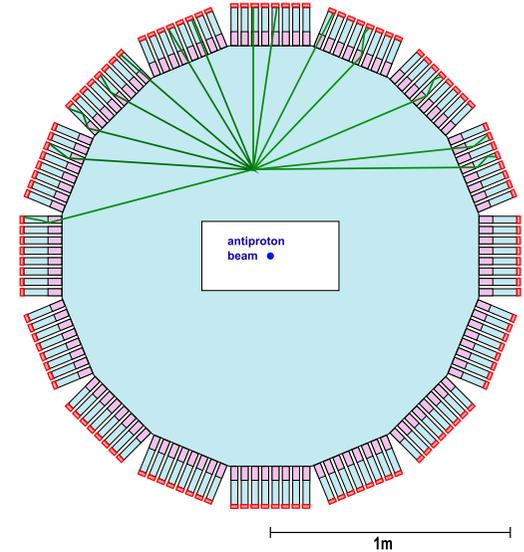

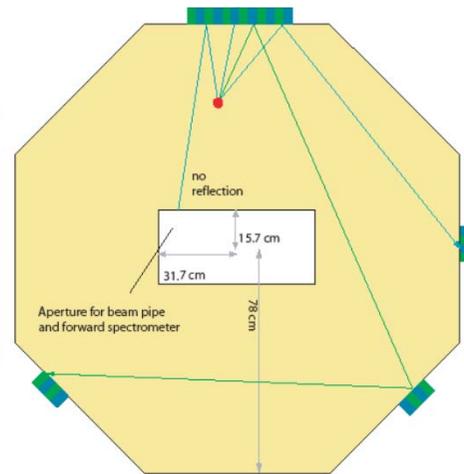

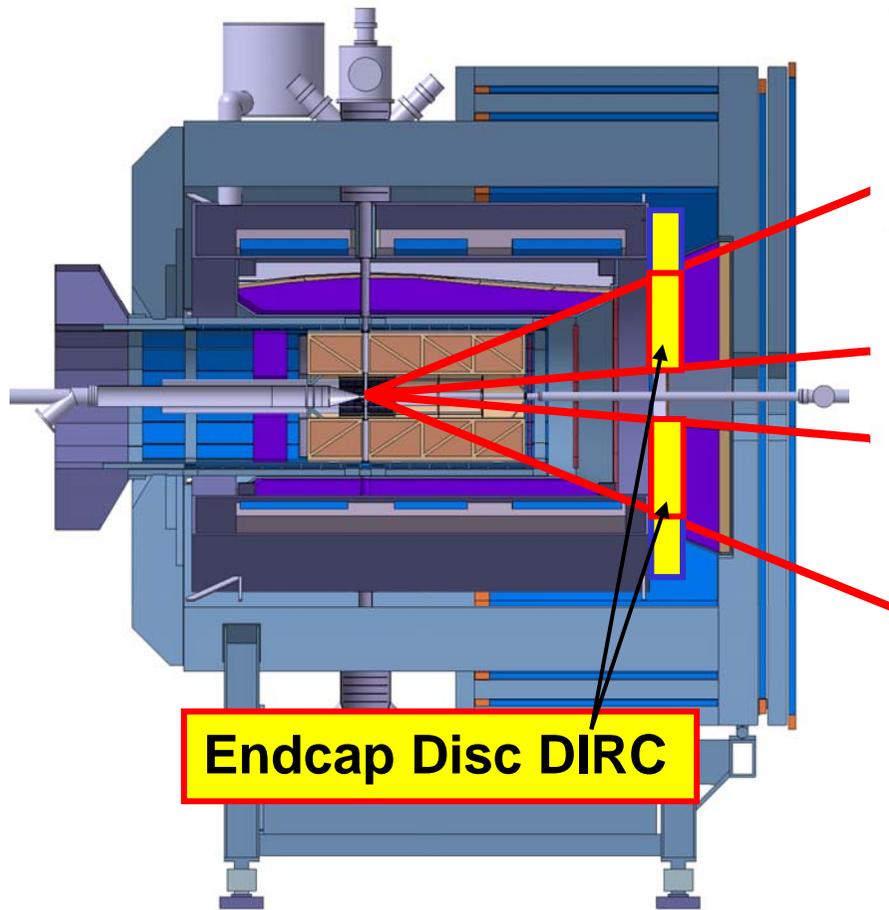

→ Talk by Mathias Hoek

PANDA endcap DIRC

Two different readout designs:

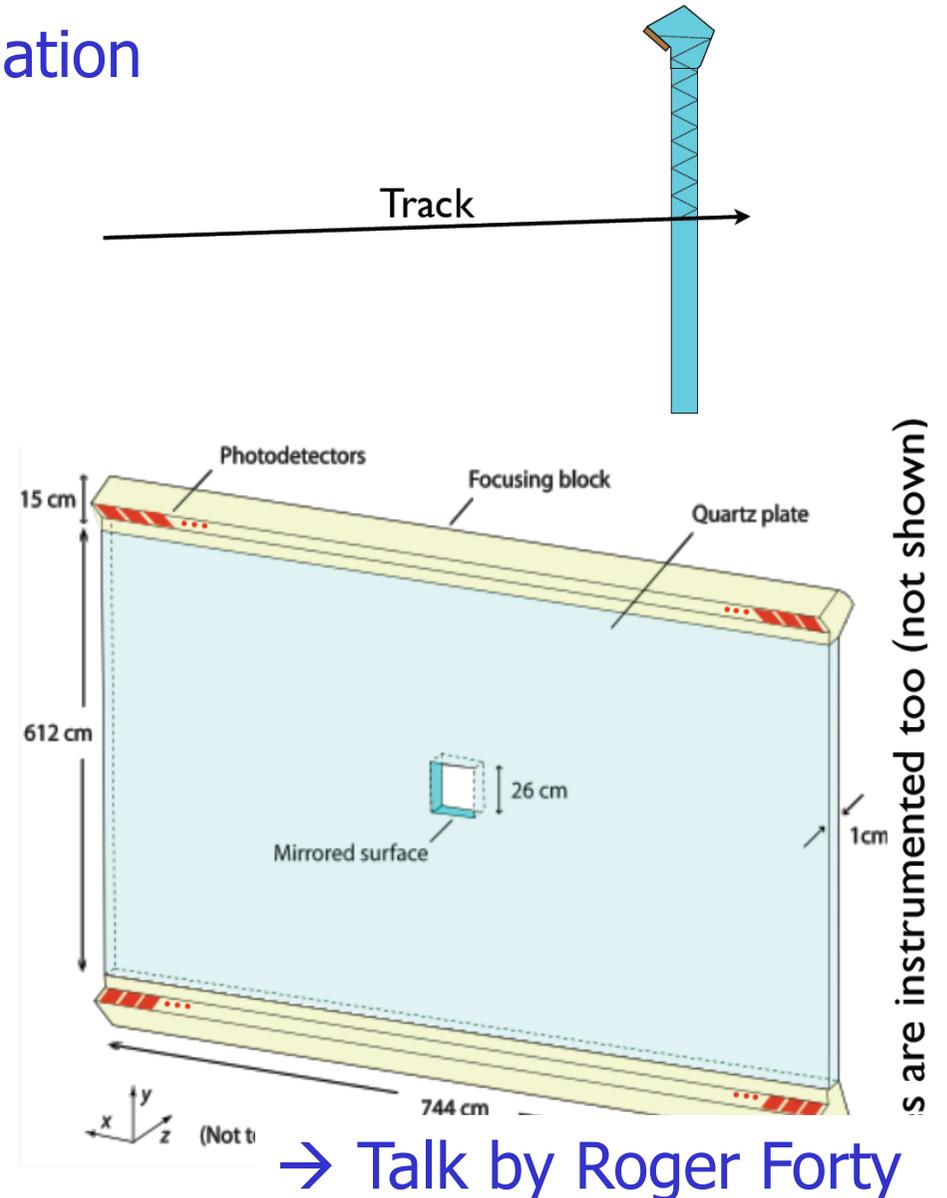

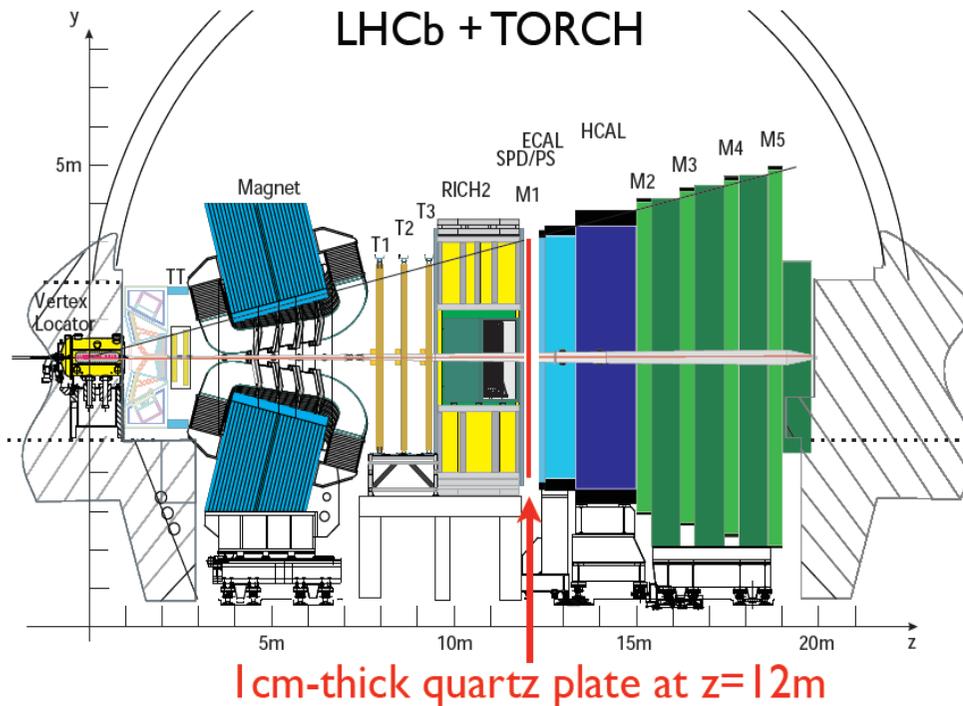

Time-of-Propagation

Focussing light guide

LHCb PID upgrade: TORCH

A special type of Time-of-Propagation counter for the LHCb upgrade

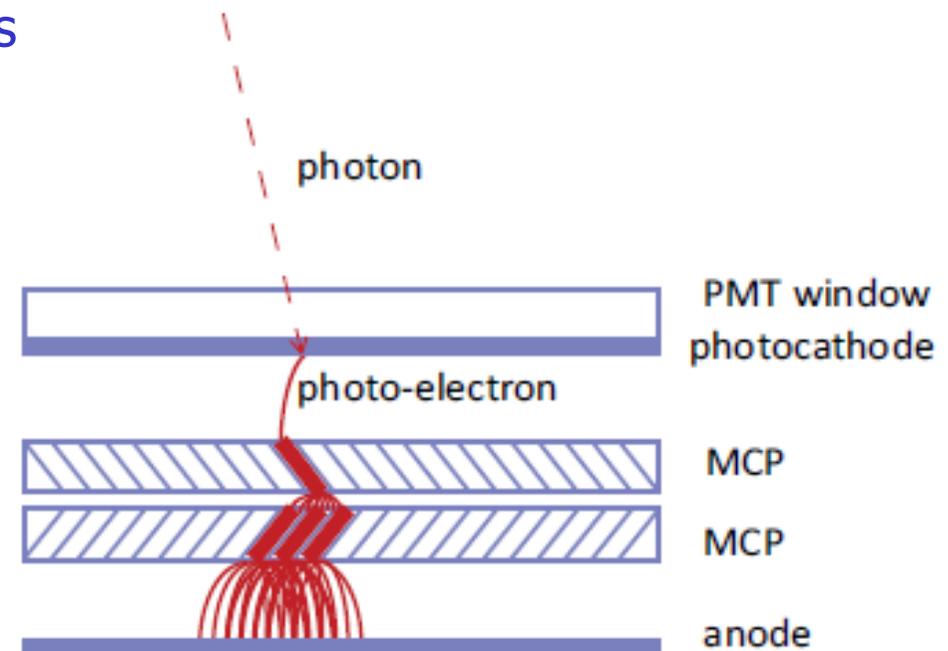

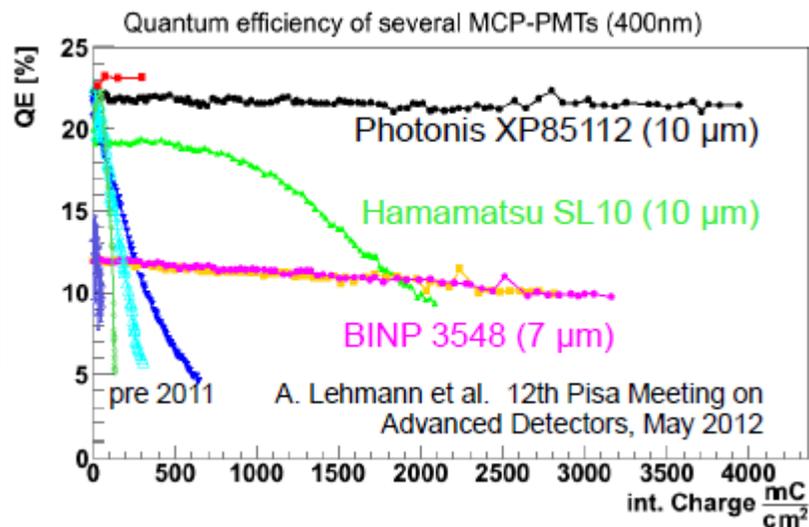

MCP PMTs ageing

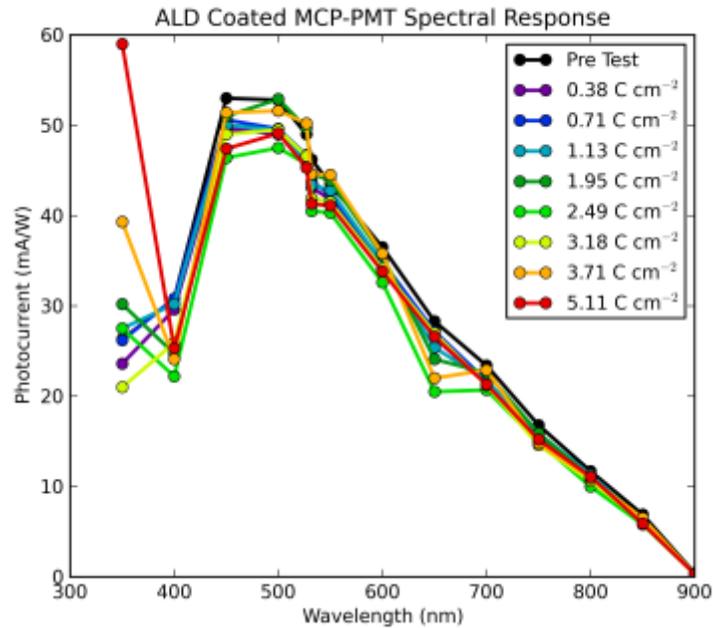

MCP PMT ageing: a serious problem in most of the planned applications.

Cures:

- Better cleaning of the MCPs, better vacuum
- Al foil between PC and first MCP
- Al foil between two MCP stages
- Atomic layer deposition (ALD)

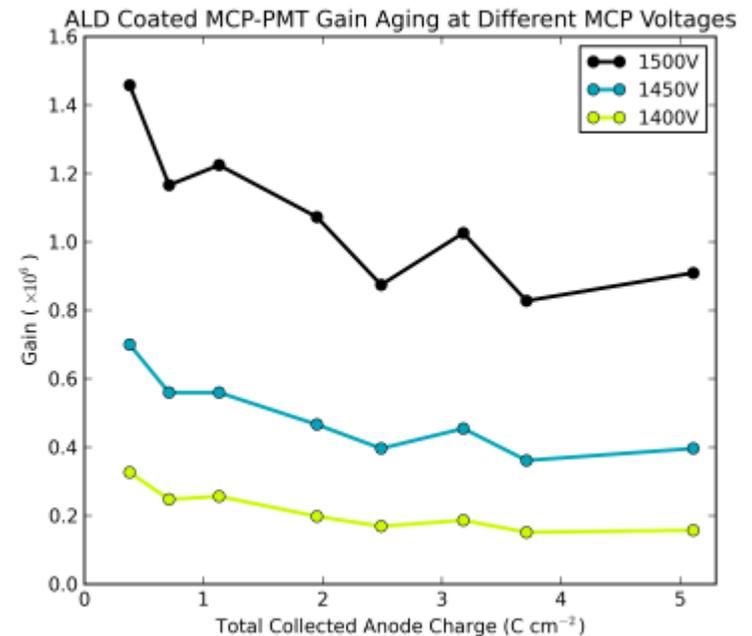

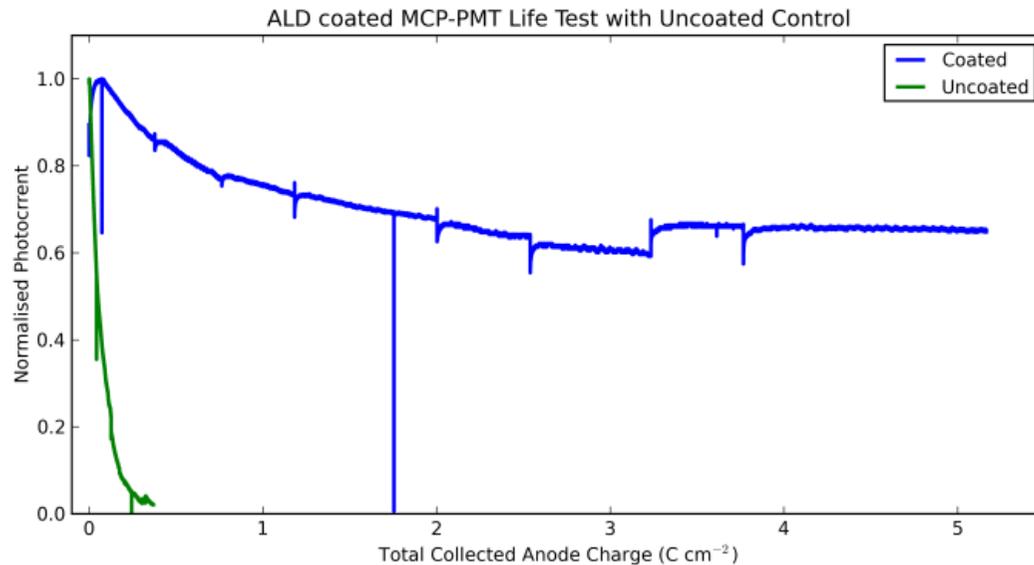

MCP PMTs ageing, cure

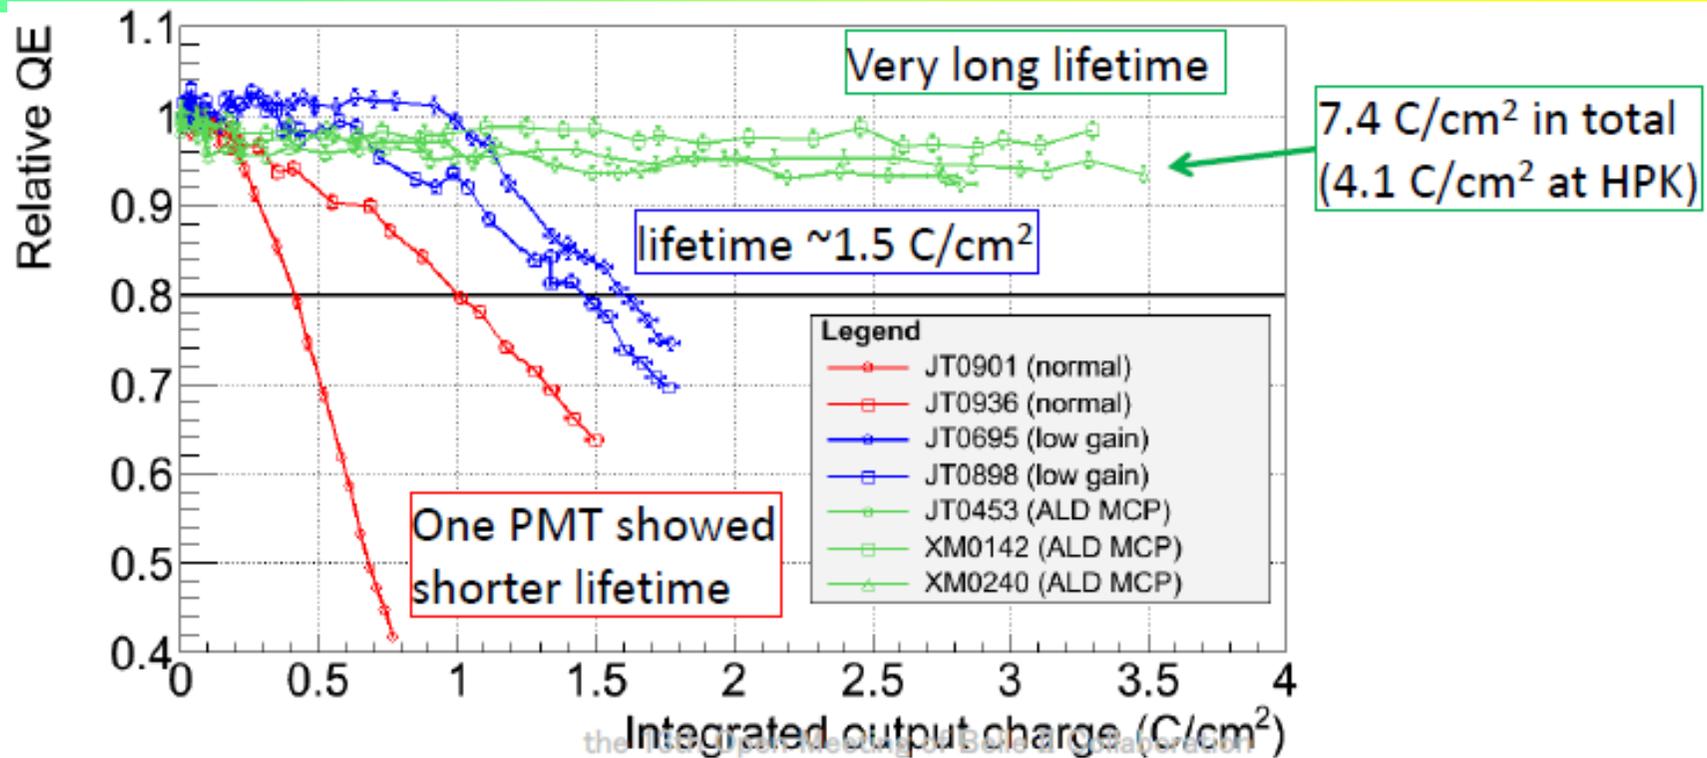

Photek, ALD deposition

No drop in QE after 5 C/cm²

Photo current drop due to a reduced gain (microchannel plate ageing)

MCP PMTs ageing, cure

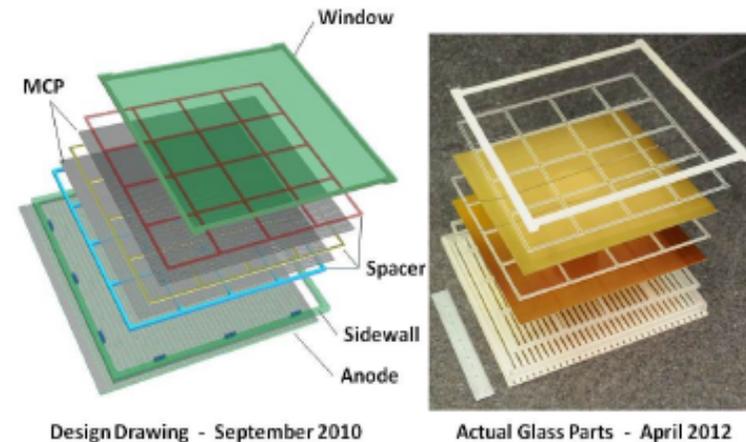

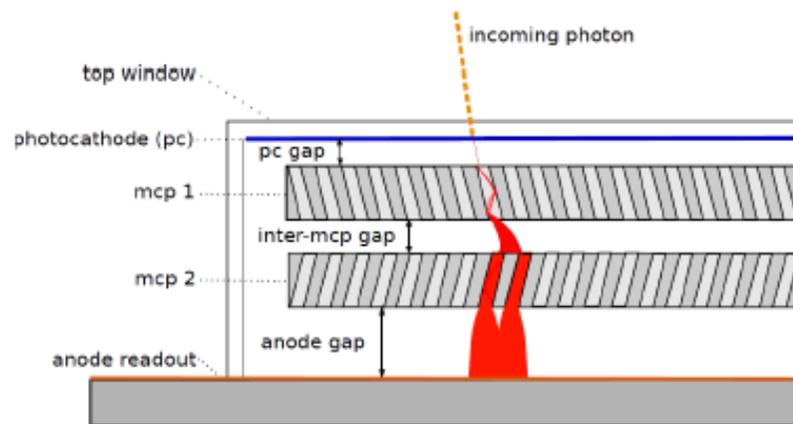

Hamamatsu, ALD deposition

No drop in QE after 7.4 C/cm^2

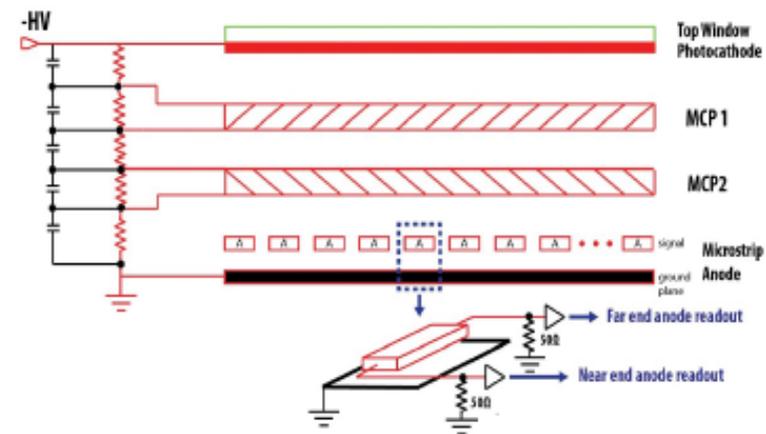

LAPPD – Large Area Picosecond Photon Detector

Glass Package (20x20cm²)

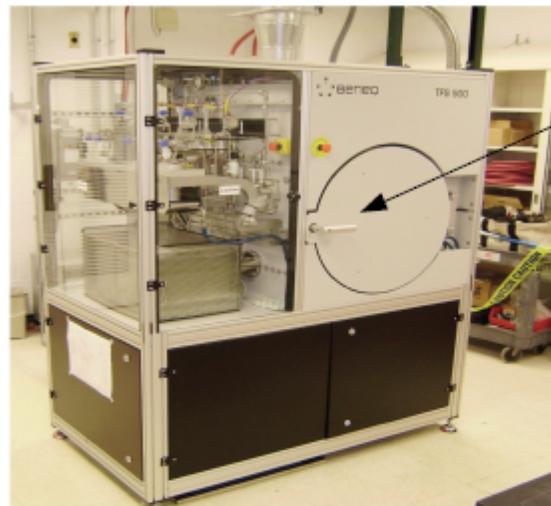

- Cheap, widely available float glass
- Anode is made by silk-screening
- Flat panel
- No pins, single HV cable
- Modular design
- High bandwidth 50 Ω object
- designed for fast timing

The Frugal Tile

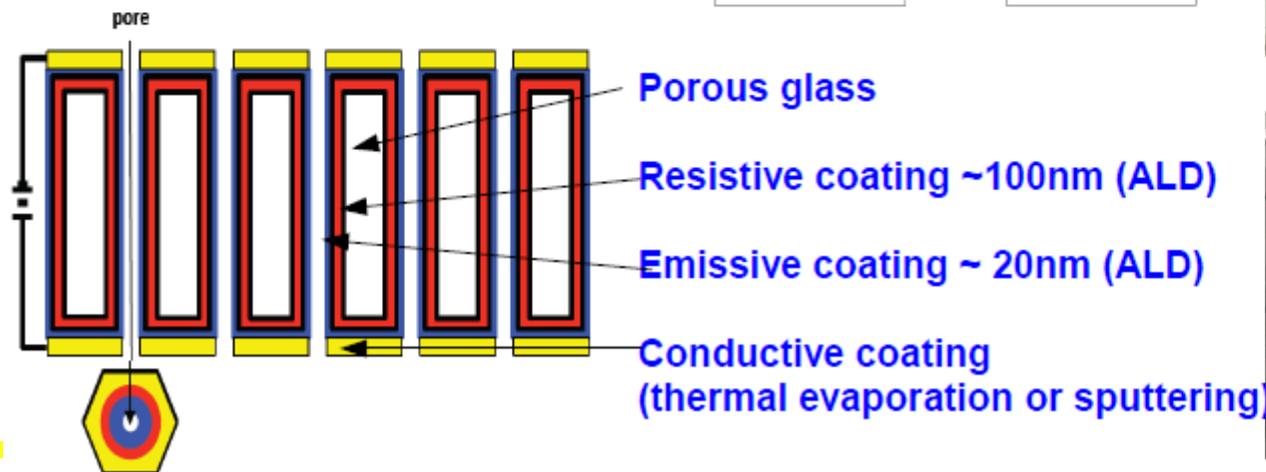

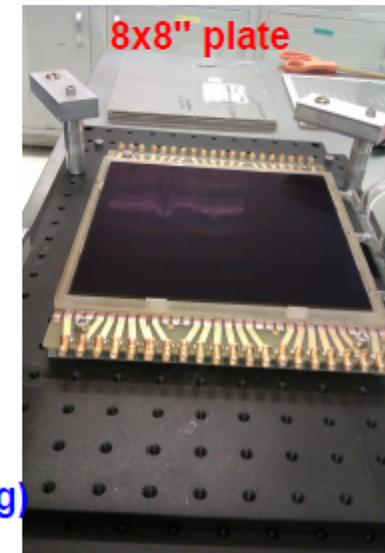

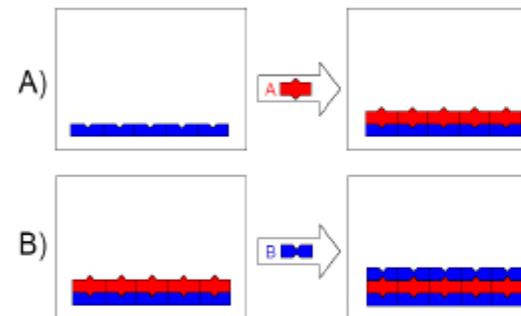

LAPPD – Large Area Picosecond Photon Detector

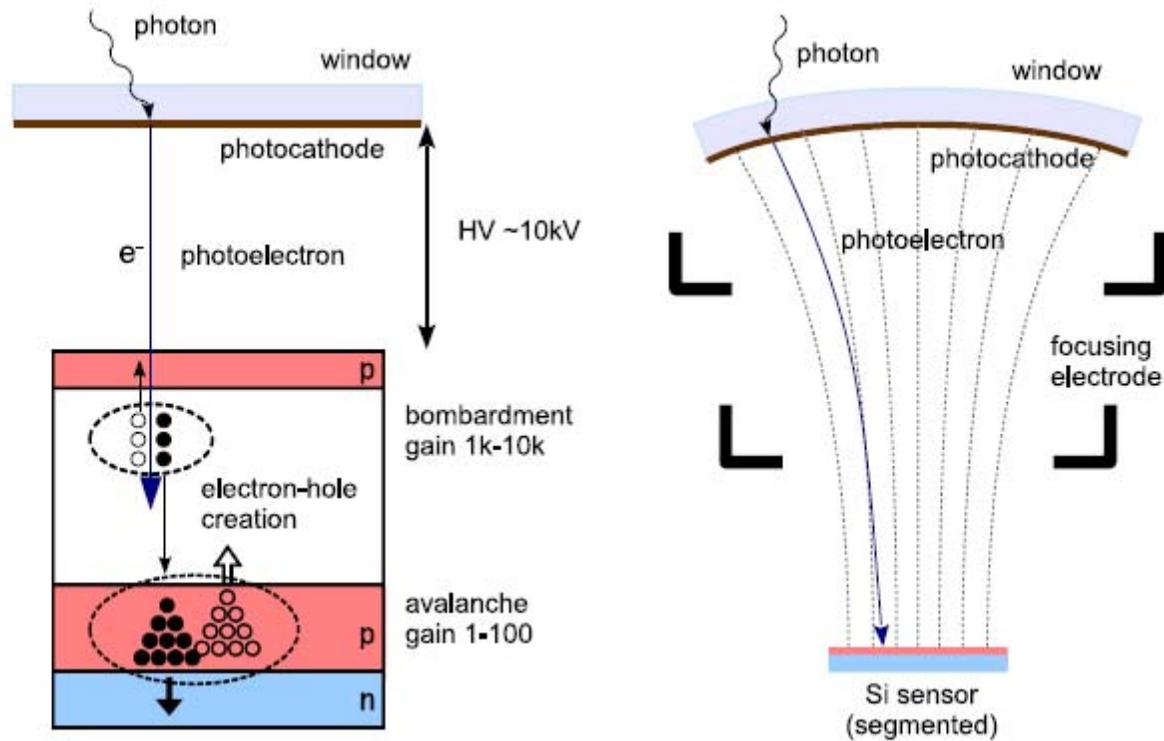

MCP by Atomic Layer Deposition (ALD)

Beneq reactor for ALD
@Argonne National Laboratory
A.Mane, J.Elam

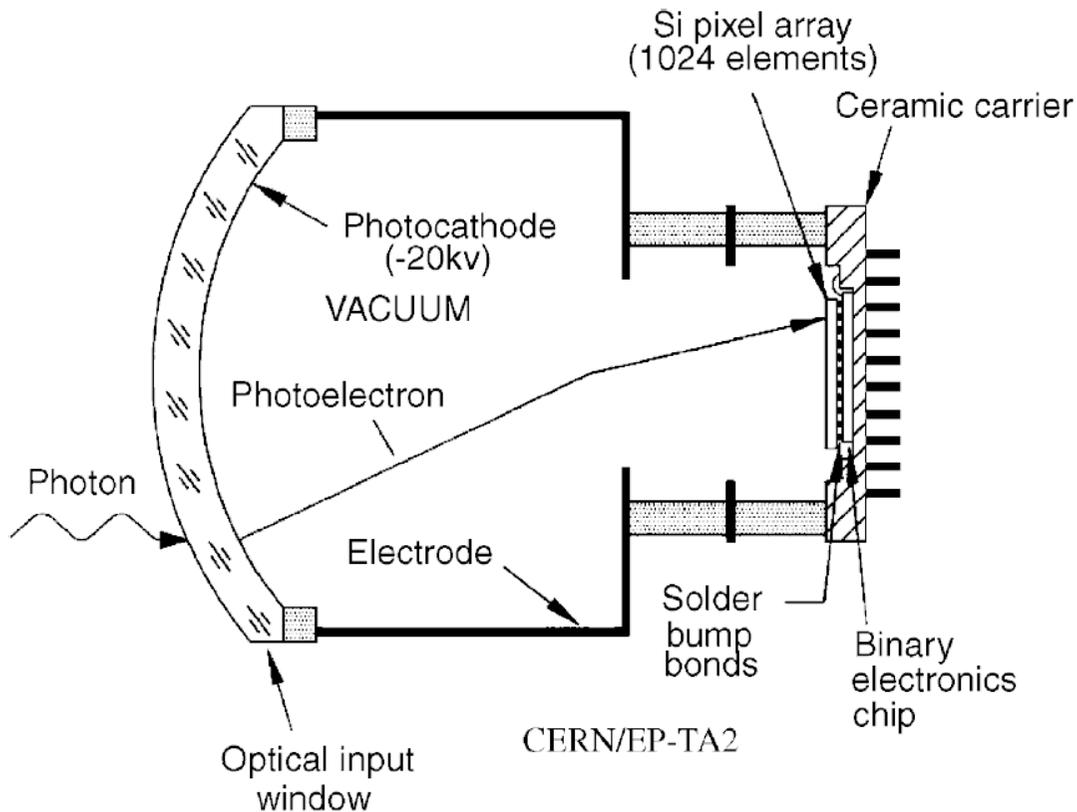

Hybrid photodetectors

Hybrid photodetector: LHCb RICHes

Photon detector: hybrid PMT (R+D with DEP) with 5x demagnification (electrostatic focusing).

Hybrid PMT: accelerate photoelectrons in electric field ($\sim 20\text{kV}$), detect it in a pixelated silicon detector.

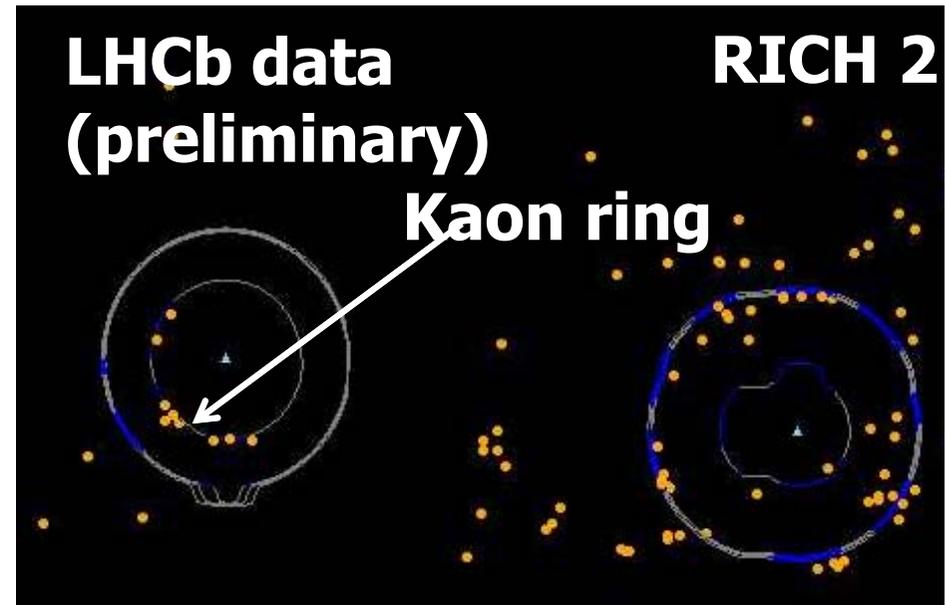

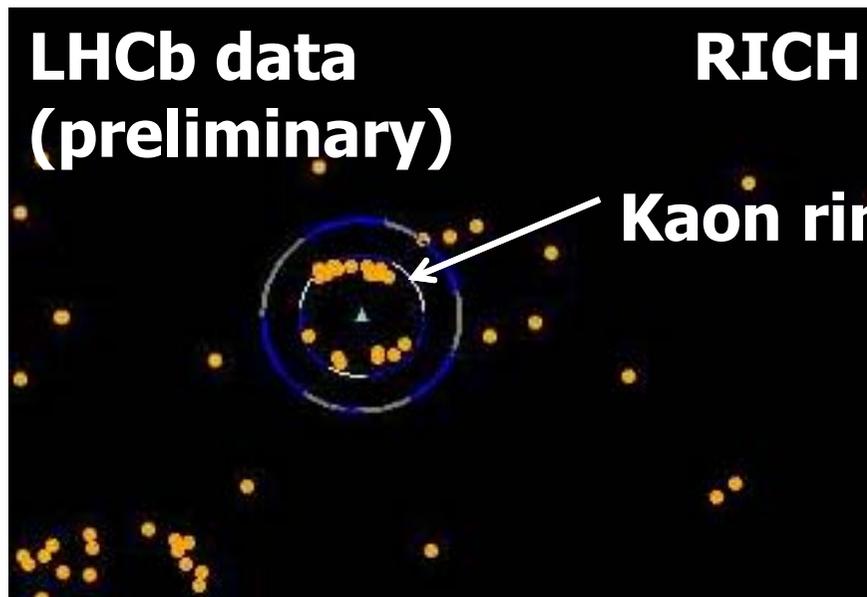

NIM A553 (2005) 333

LHCb Event Display

RICH1

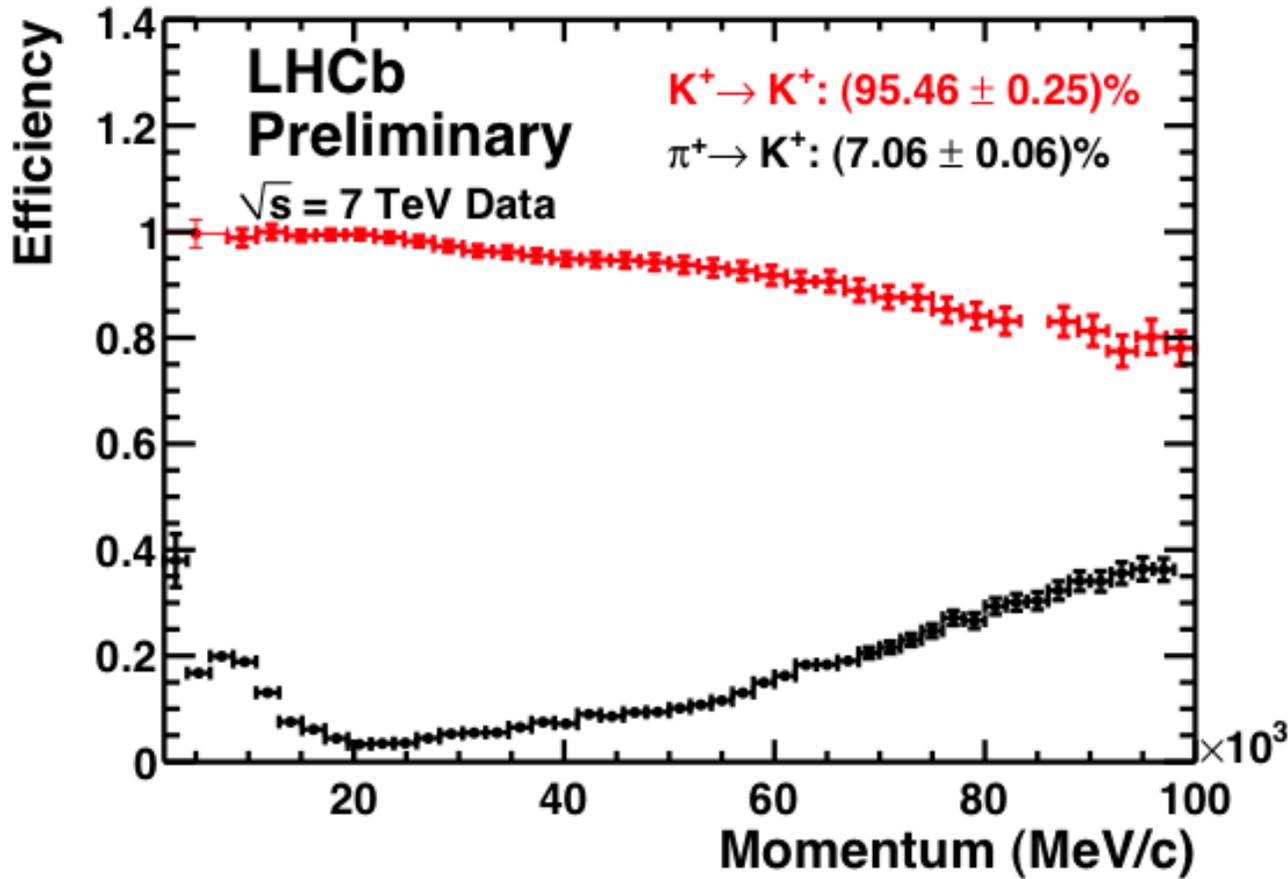

Early data, Nov/Dec 2009
LHC beams $\sqrt{s} = 900$ GeV

RICH2

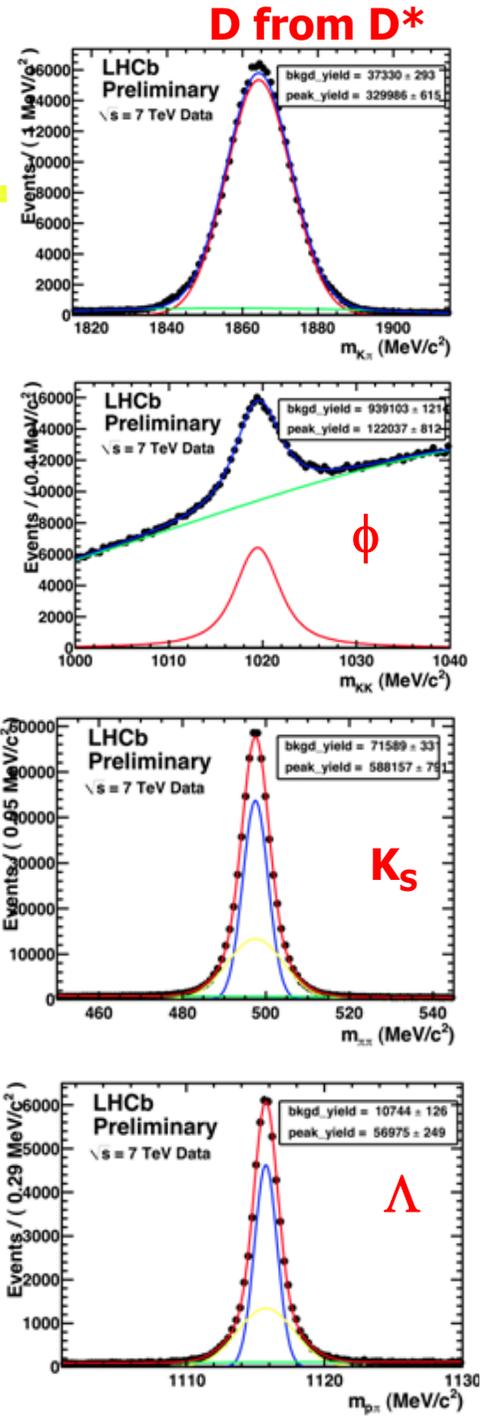

- Orange points → photon hits
- Continuous lines → expected distribution for each particle hypothesis

LHCb RICHes: performance

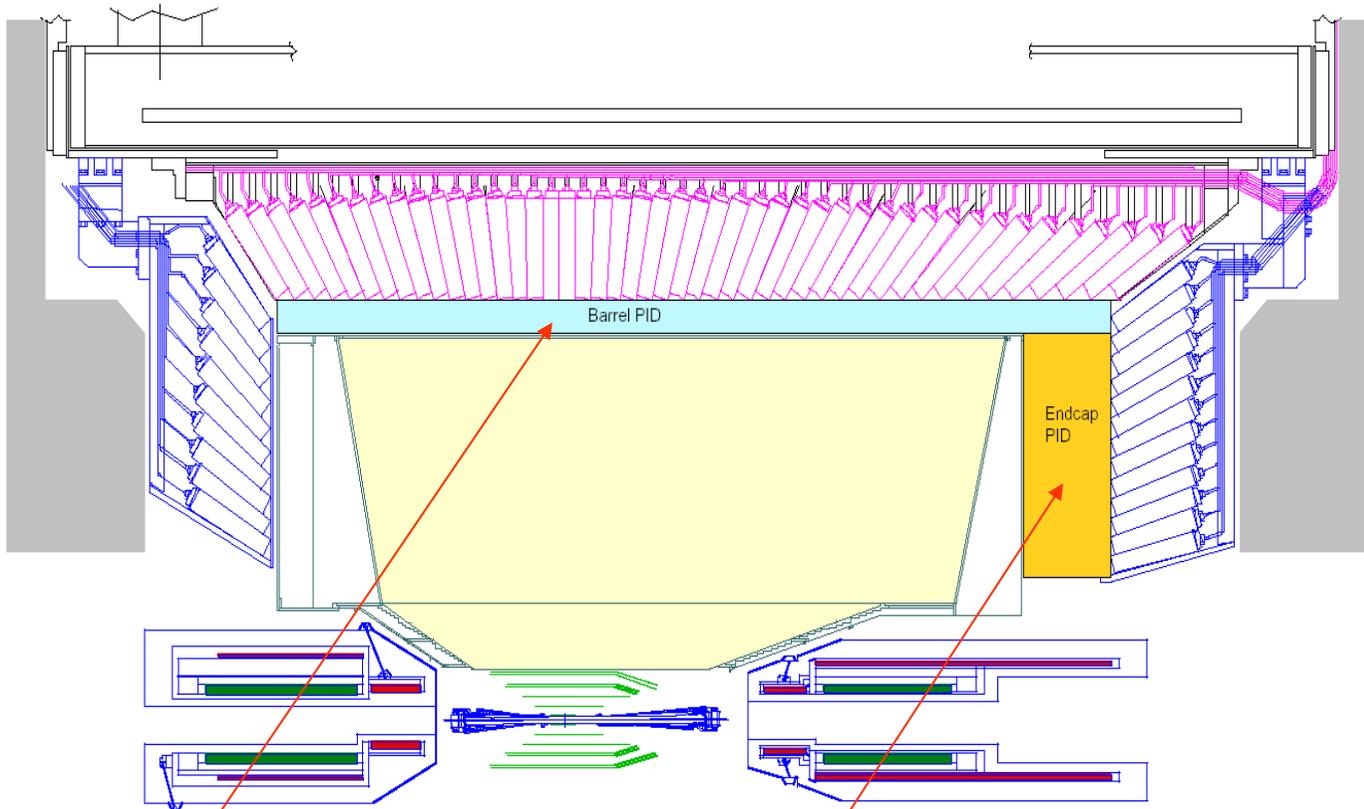

Efficiency and purity from data →
 excellent agreement with MC

N. Harnew, Beauty 2011

Belle upgrade – side view

Two new particle ID devices, both RICHes:

Barrel: **time-of-propagation (TOP) counter**

Endcap: **proximity focusing RICH**

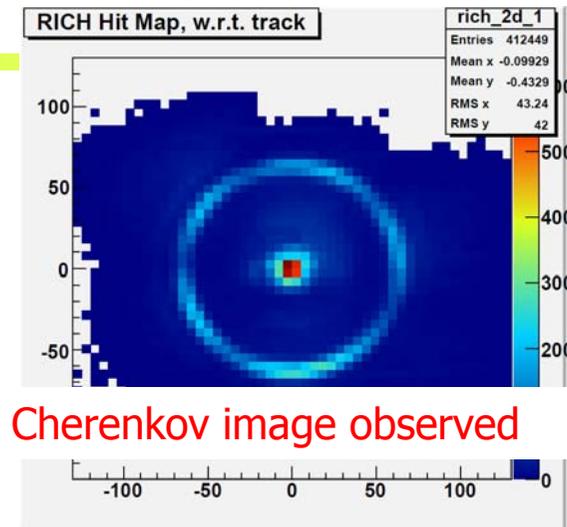

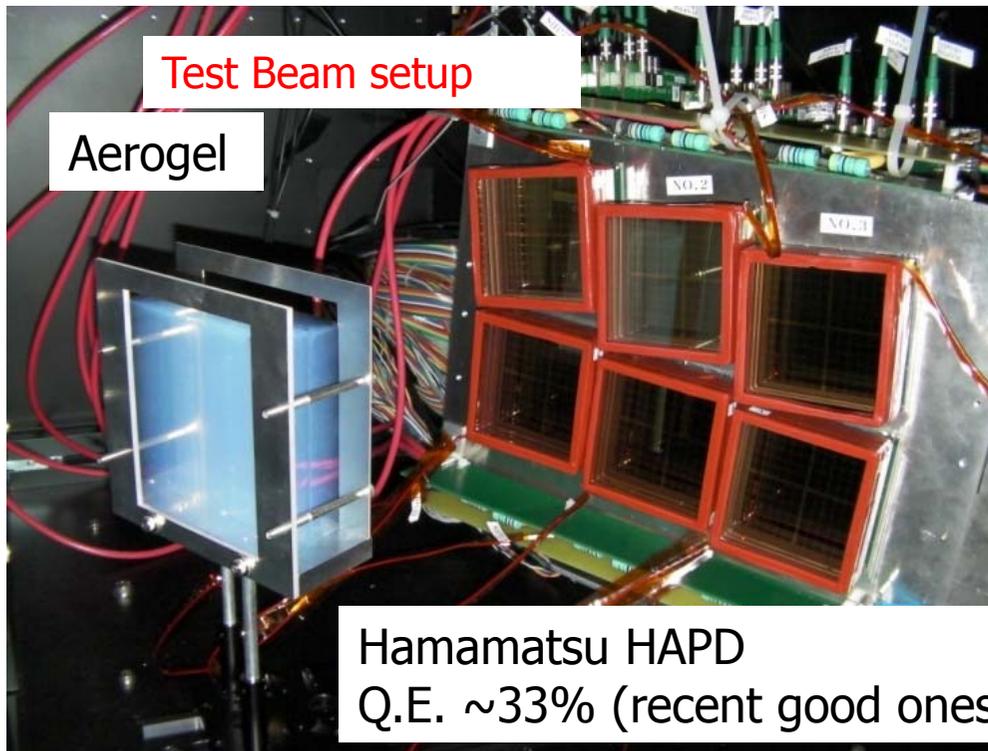

Aerogel RICH photon detectors

Need:

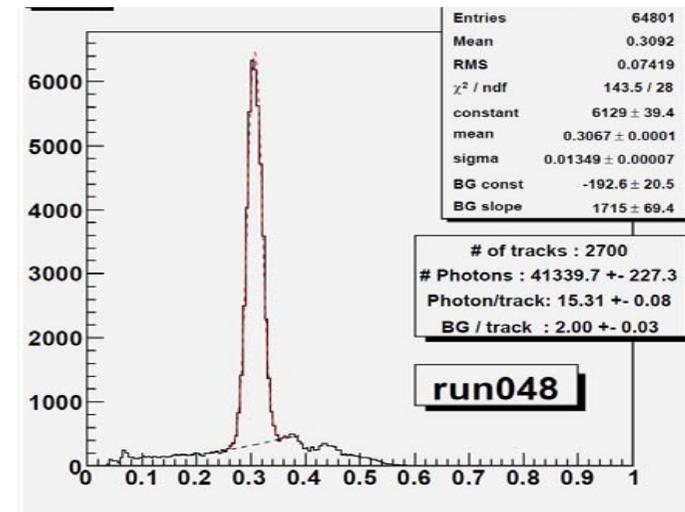

Operation in 1.5 T magnetic field

Pad size $\sim 5\text{-}6\text{mm}$

Baseline option: large active area HAPD
of the proximity focusing type

Cherenkov angle distribution

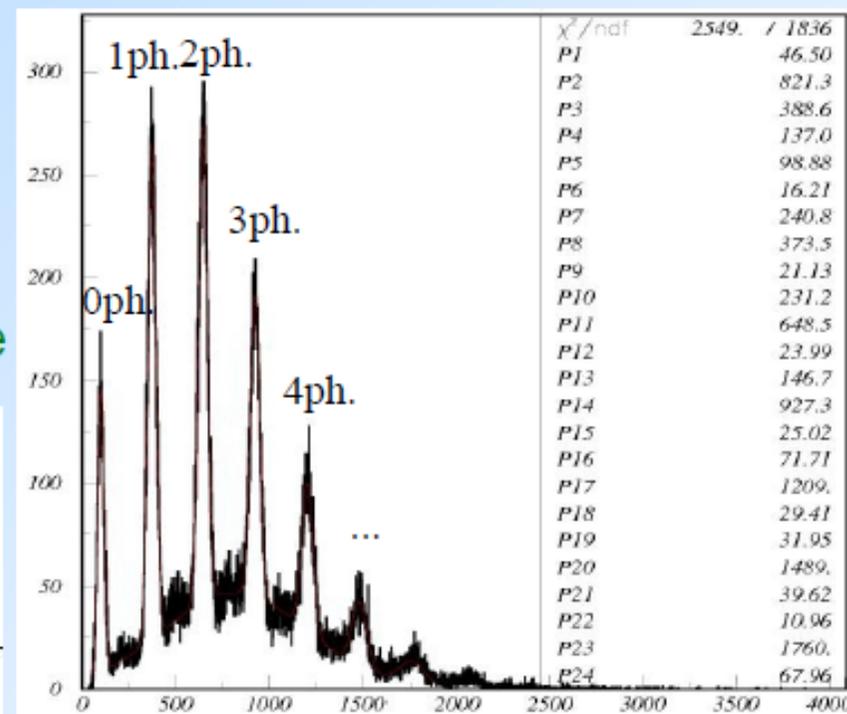

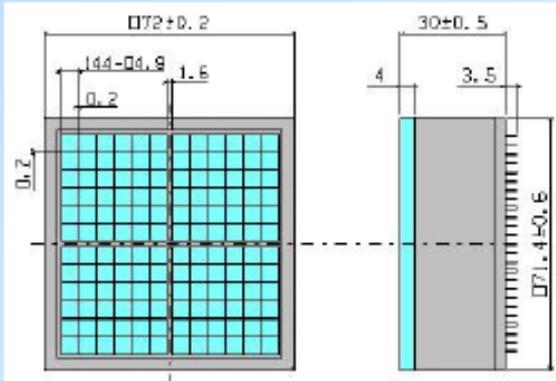

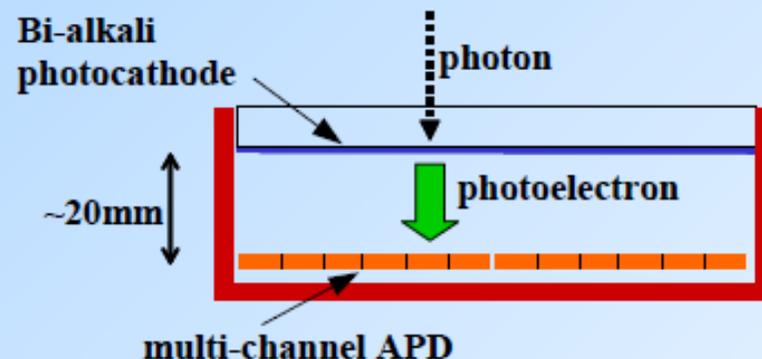

6.6 σ p/K at 4GeV/c !

\rightarrow NIM A595 (2008) 180

ARICH photon detector: HAPD

Hybrid avalanche photo-detector developed in cooperation with Hamamatsu (proximity focusing configuration):

- 12x12 channels ($\sim 5 \times 5 \text{ mm}^2$)
- size $\sim 72 \text{ mm} \times 72 \text{ mm}$
- $\sim 65\%$ effective area
- total gain $\sim 10^4 - 10^5$
(bombardment ~ 1500 , avalanche ~ 40)
- detector capacitance $\sim 80 \text{ pF/ch.}$
- typical peak QE $\sim 30\%$
- works in mag. field (\sim perpendicular to the entrance window)

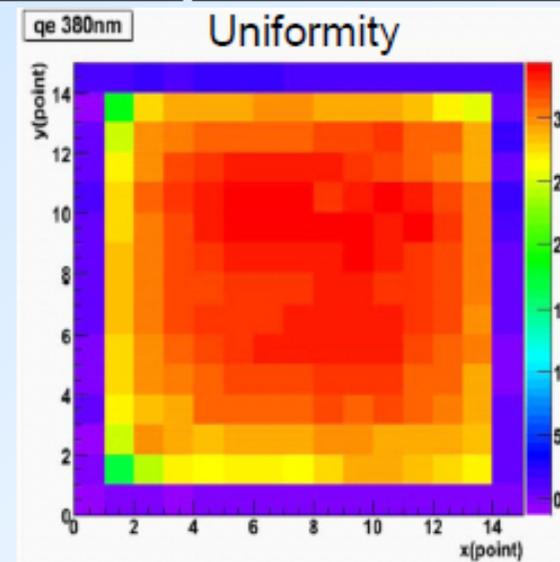

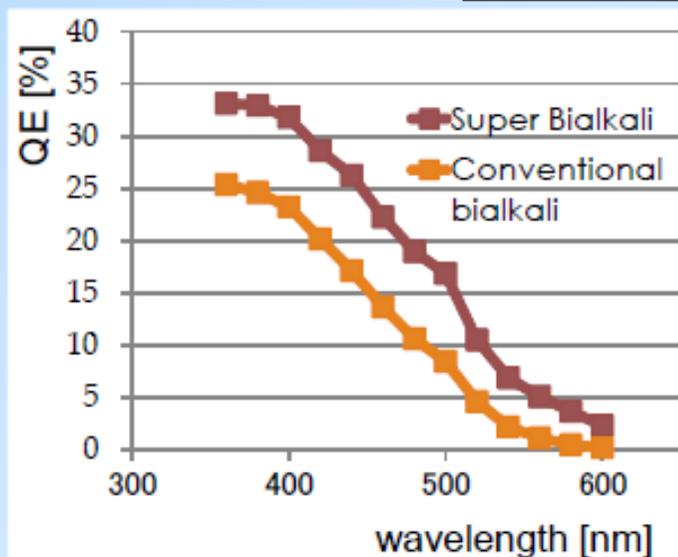

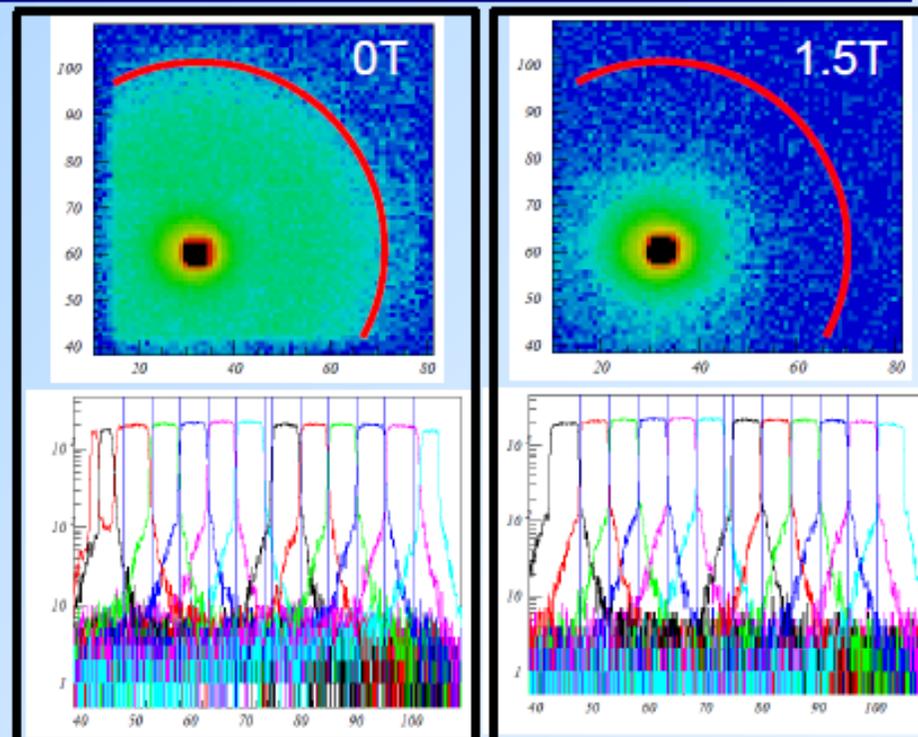

ARICH photon detector: HAPD

Tests in 1.5 T magnetic field show improved performance:

- no photoelectron back-scattering cross-talk
- Effect of non-uniformity of electric field disappears

QE improved by Hamamatsu with super bialkali photocathode:
25% → 32% peak

SiPM as photon detector?

Can we use SiPM (Geiger mode APD) as the photon detector in a RICH counter?

+immune to magnetic field

+high photon detection efficiency, single photon sensitivity

+easy to handle (thin, can be mounted on a PCB)

+potentially cheap (not yet...) silicon technology

+no high voltage

-very high dark count rate (100kHz – 1MHz) with single photon pulse height

-radiation hardness

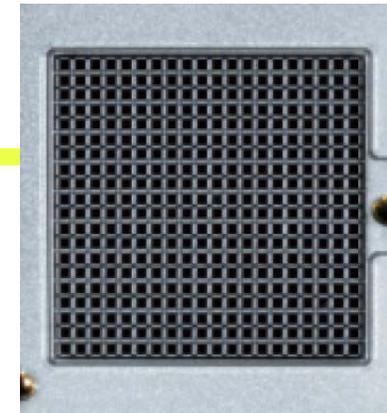

SiPMs as photon detectors?

SiPM is an array of APDs operating in Geiger mode. Characteristics:

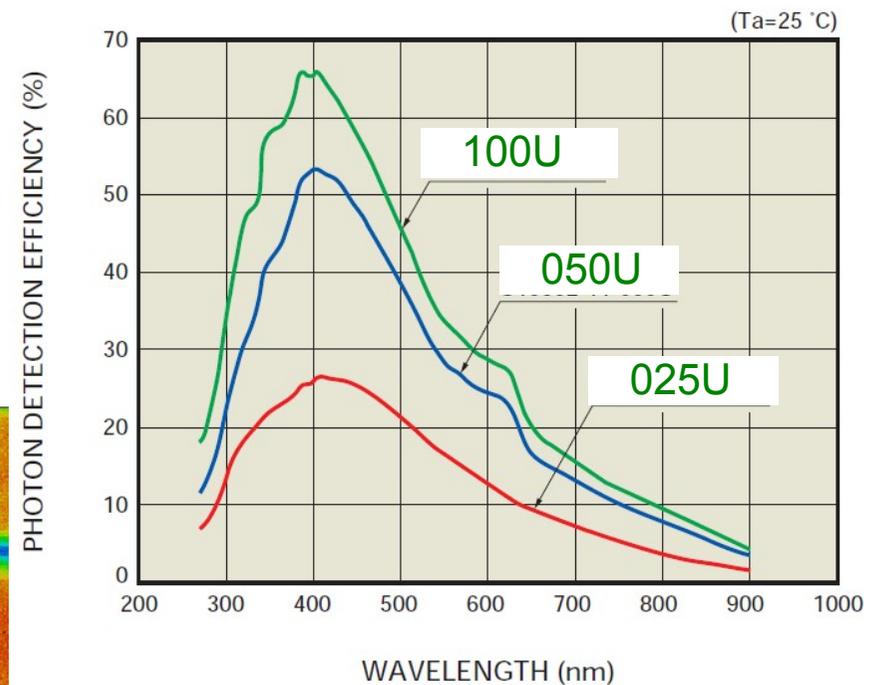

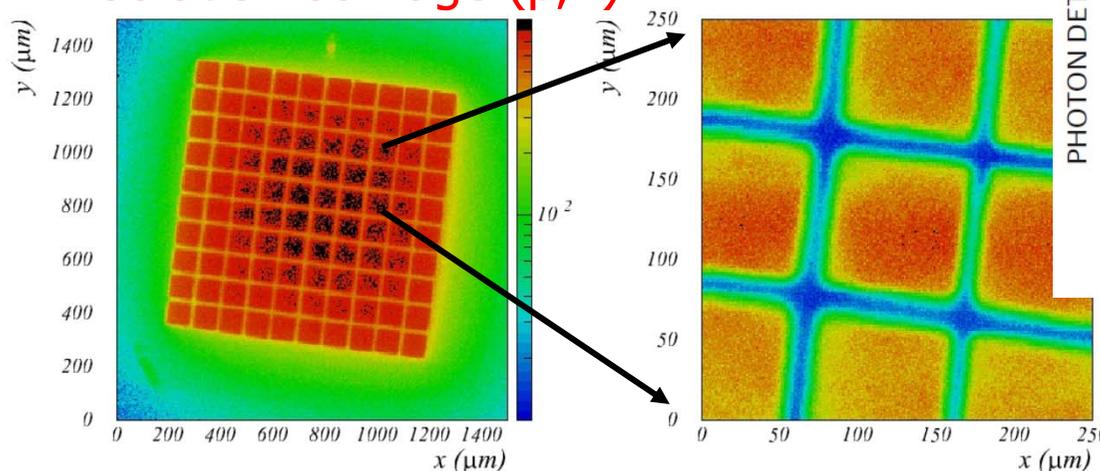

- low operation voltage $\sim 10\text{-}100\text{ V}$
- gain $\sim 10^6$
- peak PDE up to 65%(@400nm)

$$\text{PDE} = \text{QE} \times \epsilon_{\text{geiger}} \times \epsilon_{\text{geo}}$$

- ϵ_{geo} – dead space between the cells
- time resolution $\sim 100\text{ ps}$
- works in high magnetic field
- dark counts $\sim \text{few } 100\text{ kHz/mm}^2$
- radiation damage (p,n)

1 mm

Hamamatsu MPPC: S10362-11

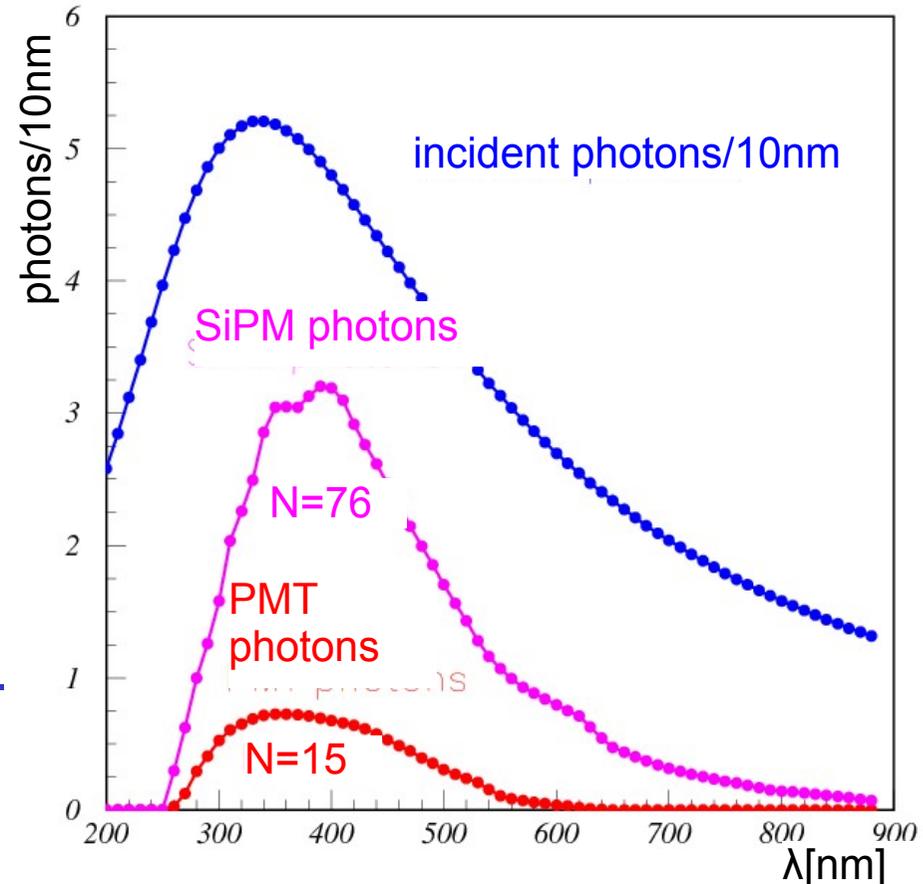

Expected number of photons for aerogel RICH

with multianode PMTs or SiPMs(100U), and
aerogel radiator: thickness 2.5 cm, $n = 1.045$
and transmission length (@400nm) 4 cm.

$$N_{\text{SiPM}}/N_{\text{PMT}} \sim 5$$

Assuming 100% detector
active area

But: Dark counts have single
photon pulse heights (rate 0.1-
1 MHz)

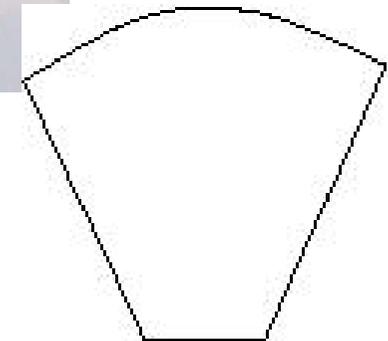

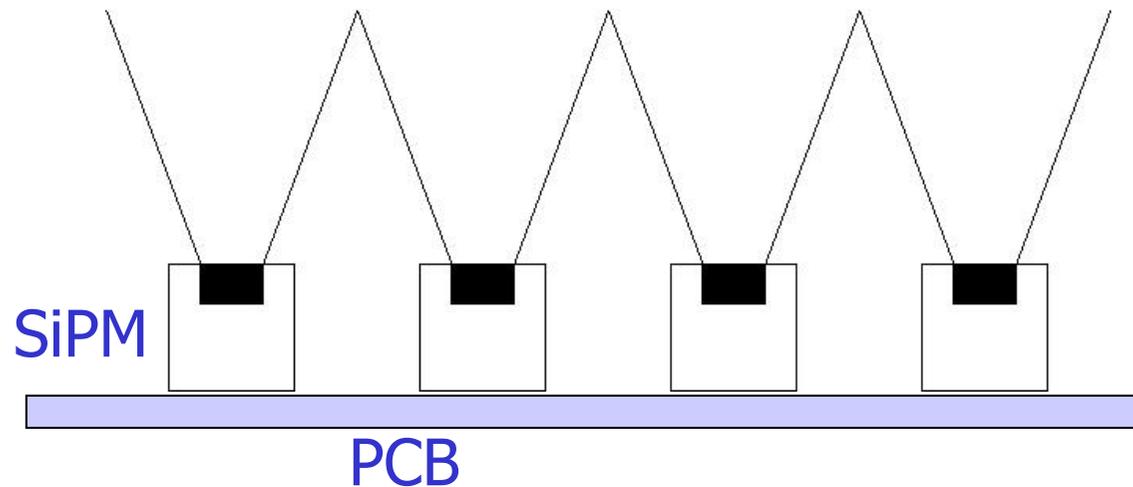

Can such a detector work?

Improve the signal to noise ratio:

- Reduce the noise by a narrow ($<10\text{ns}$) time window
- Increase the number of signal hits per single sensor by using light collectors and by adjusting the pad size to the ring thickness

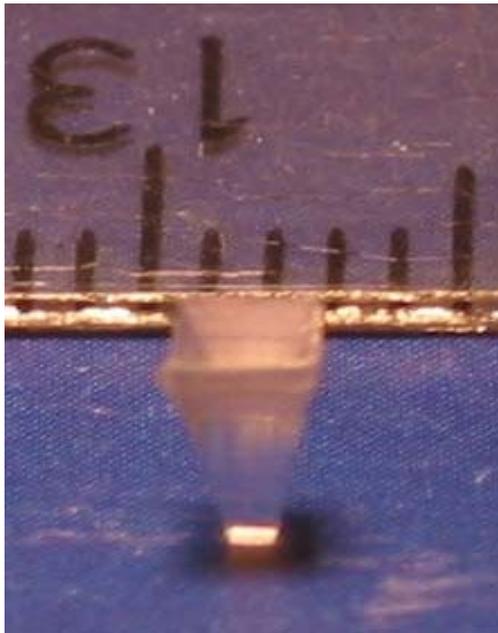

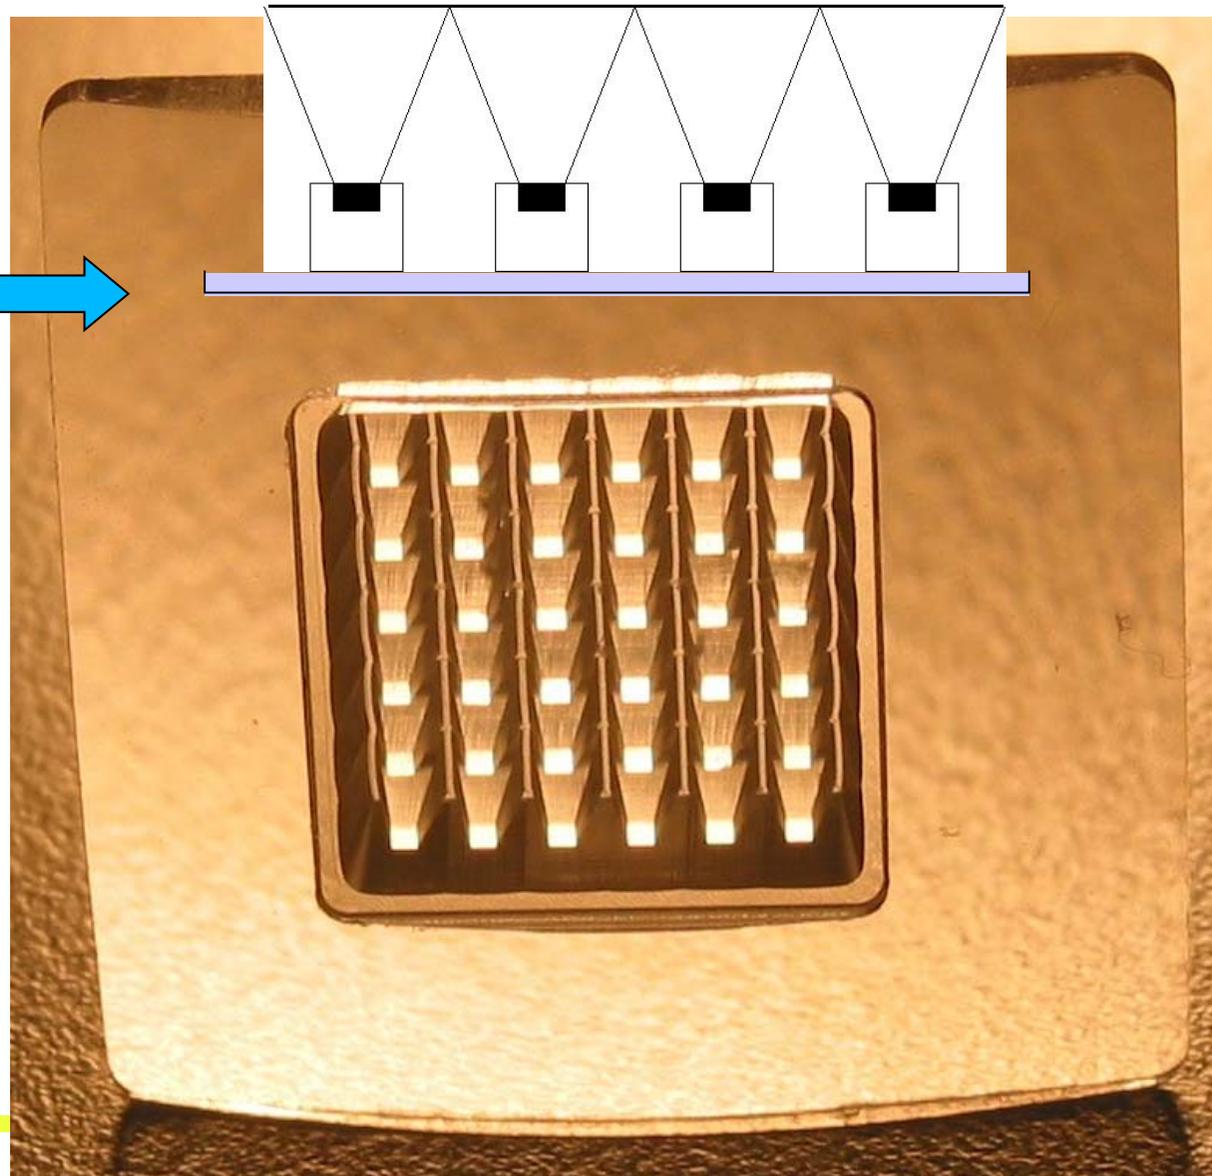

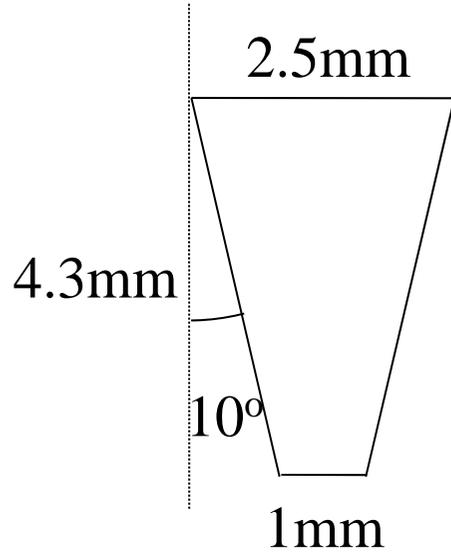

E.g. light collector with reflective walls

or combine a lens
and mirror walls

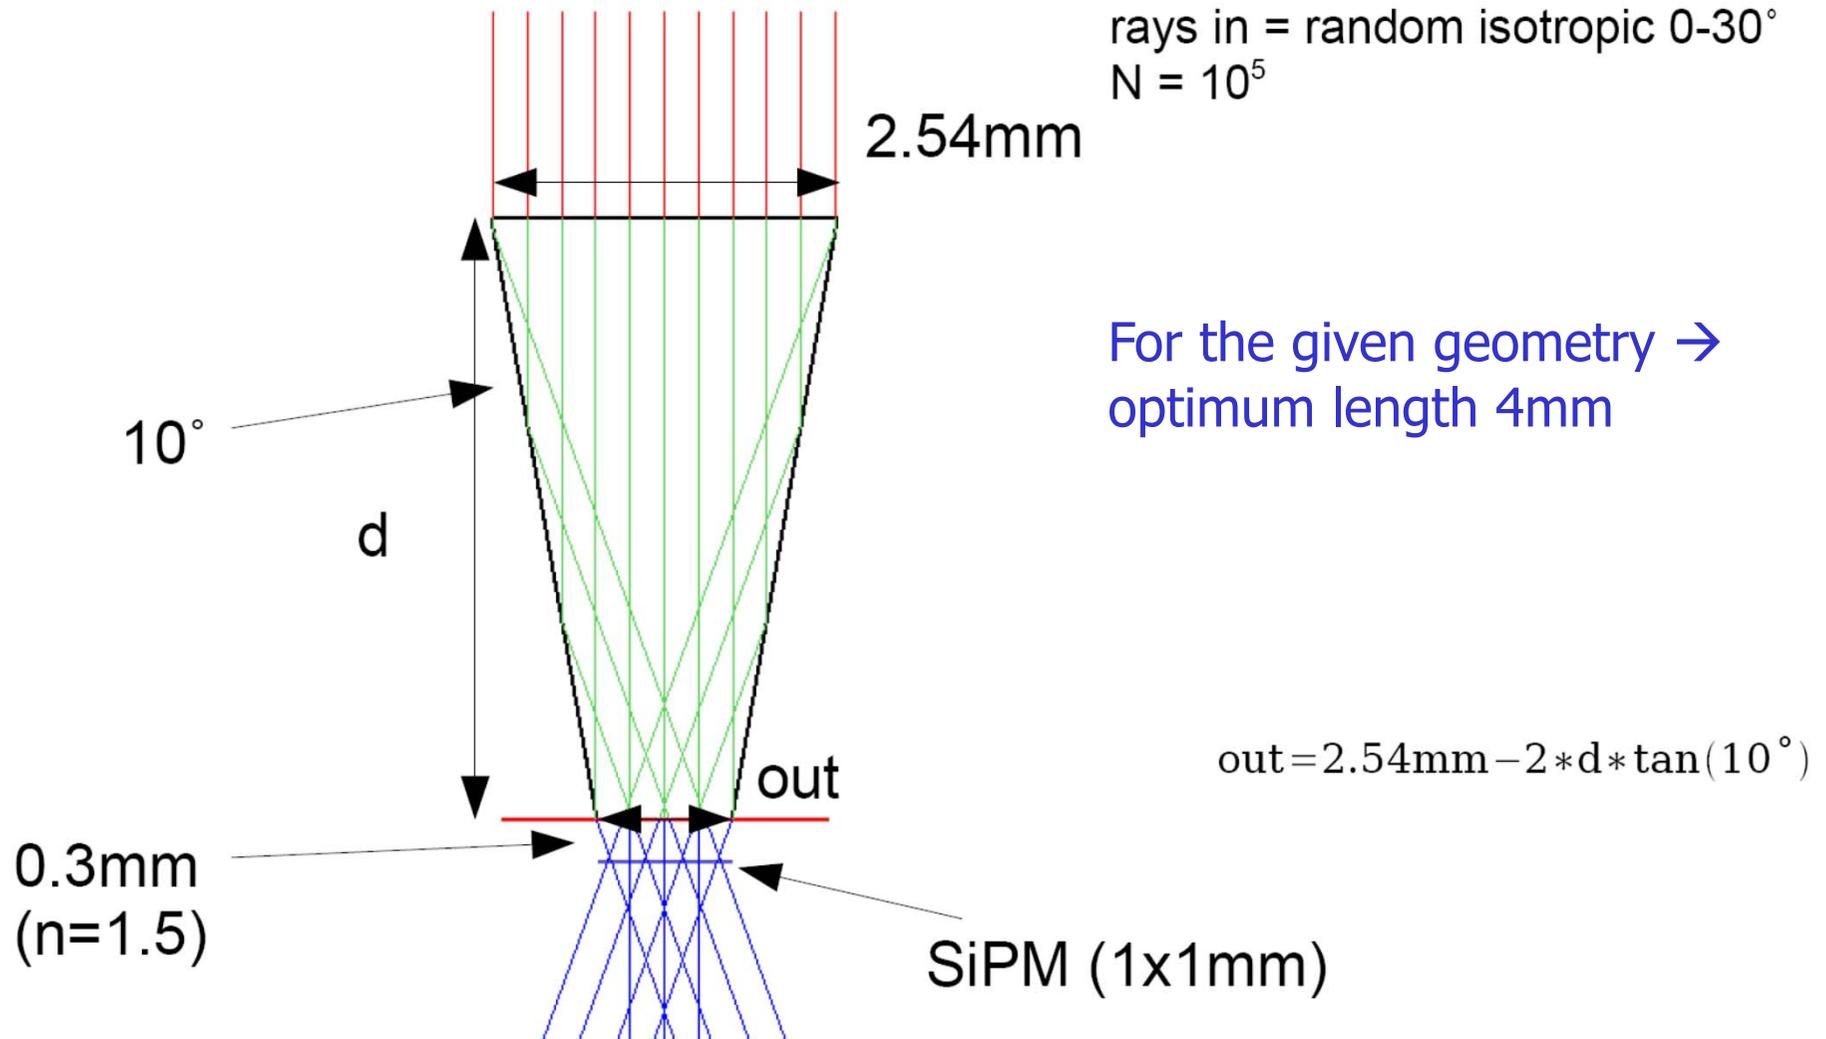

Detector module design

SiPM array with light guides

Light guide geometry optimisation

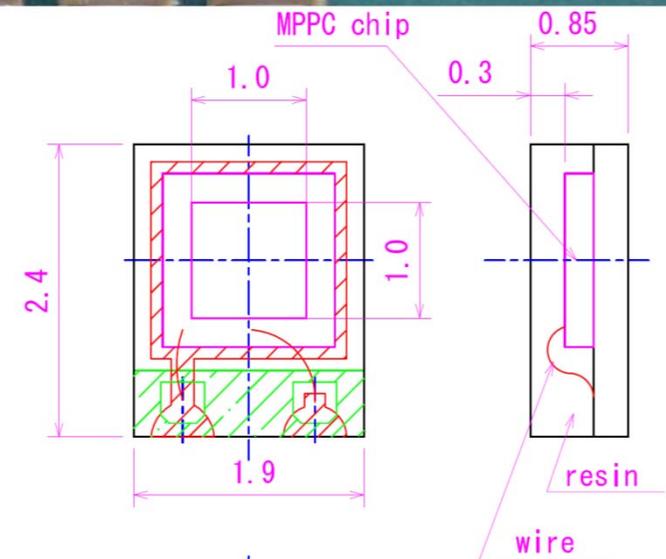

Light Guide Acceptance / (d and out)

Photon detector for the beam test

64 SiPMs

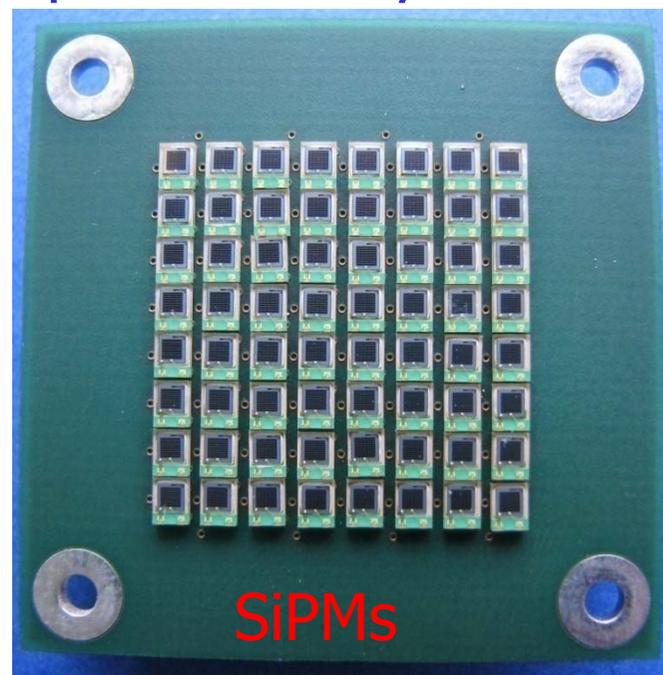

20mm

Detector module

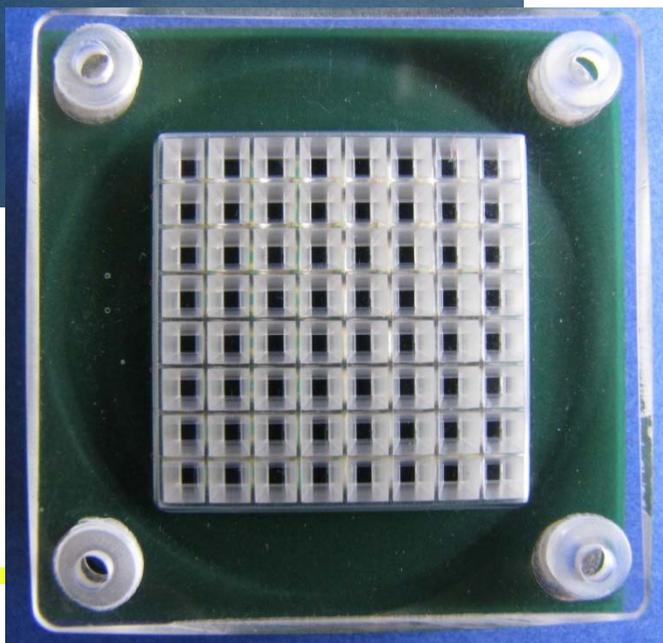

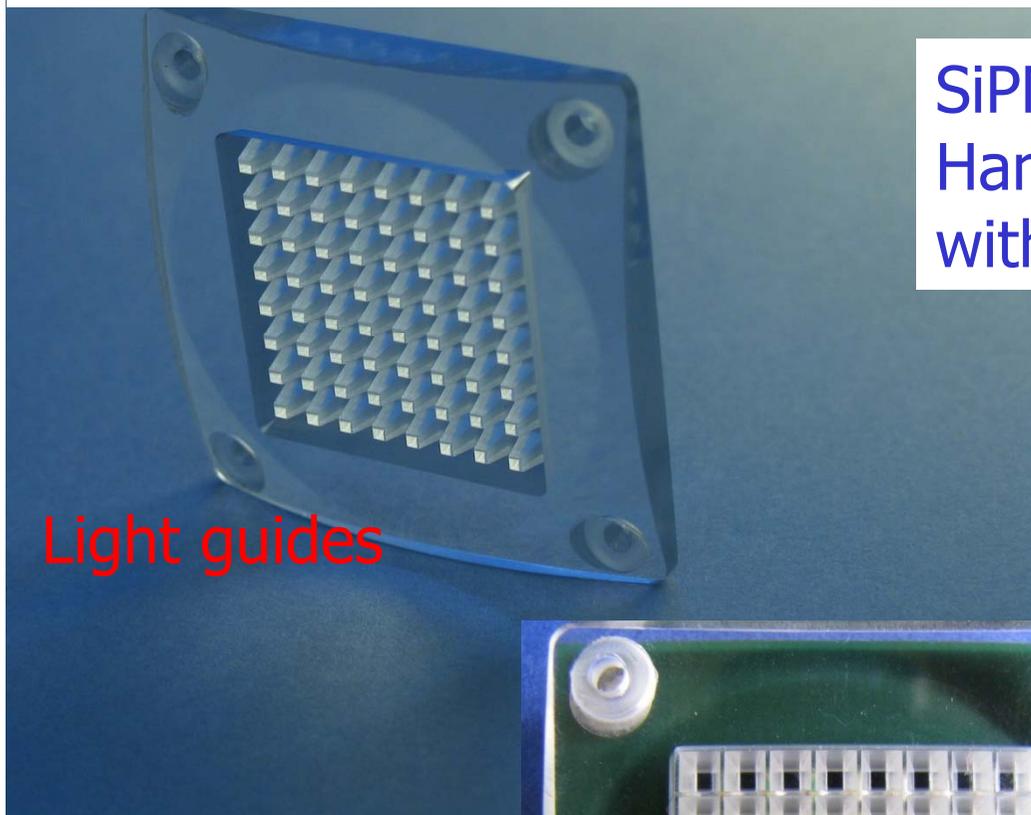

SiPMs: array of 8x8 SMD mount
Hamamatsu S10362-11-100P
with 0.3mm protective layer

Light guides

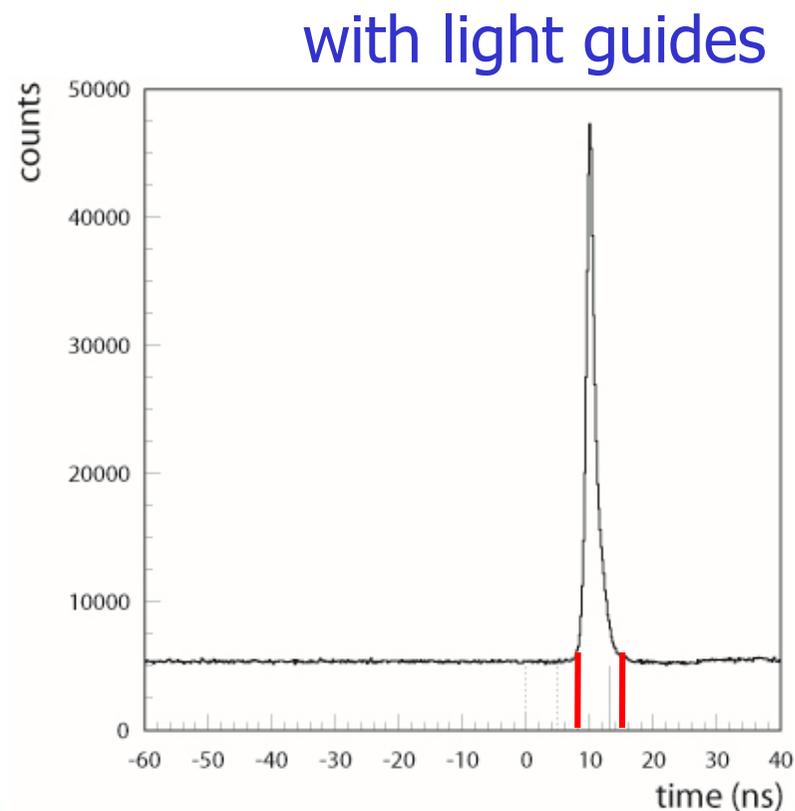

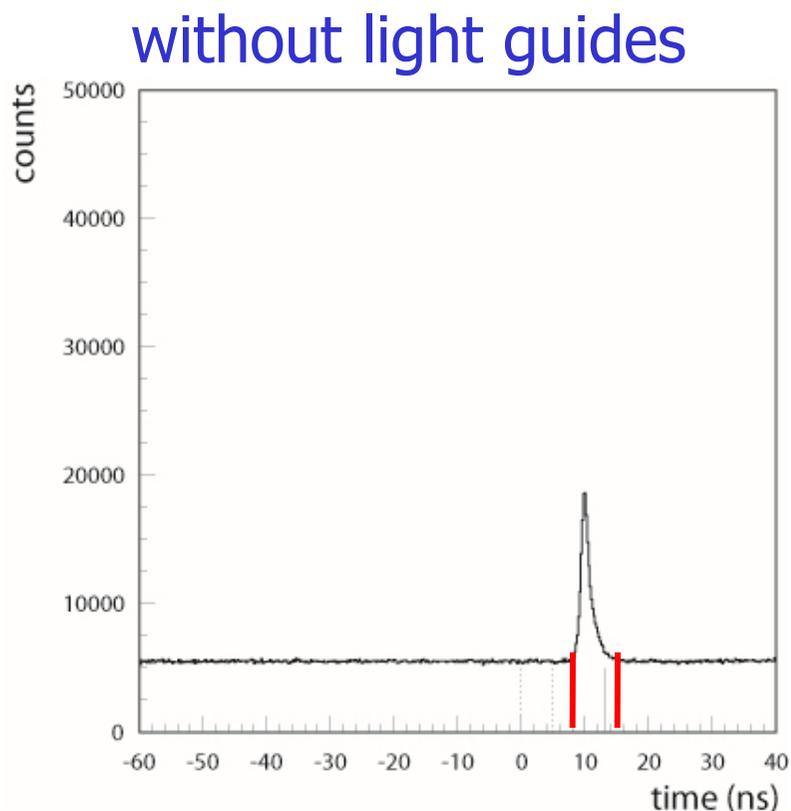

2cm

SiPMs + light guides

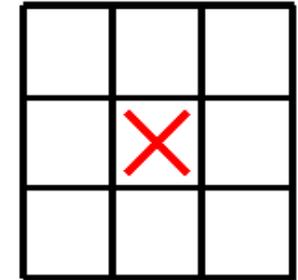

SiPM beam test: TDC distributions

- Total noise rate ~ 35 MHz (~ 600 kHz/MPPC)
- Hits in the time window of **5ns** around the peak are selected for the Cherenkov angle analysis

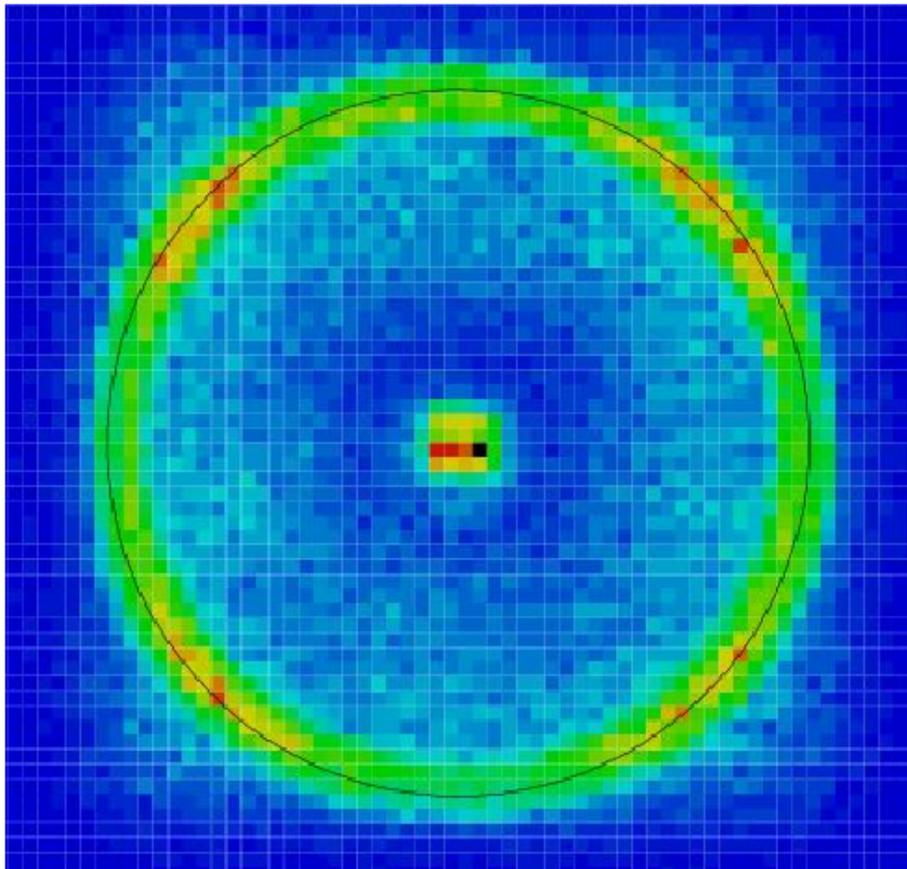

Ring images

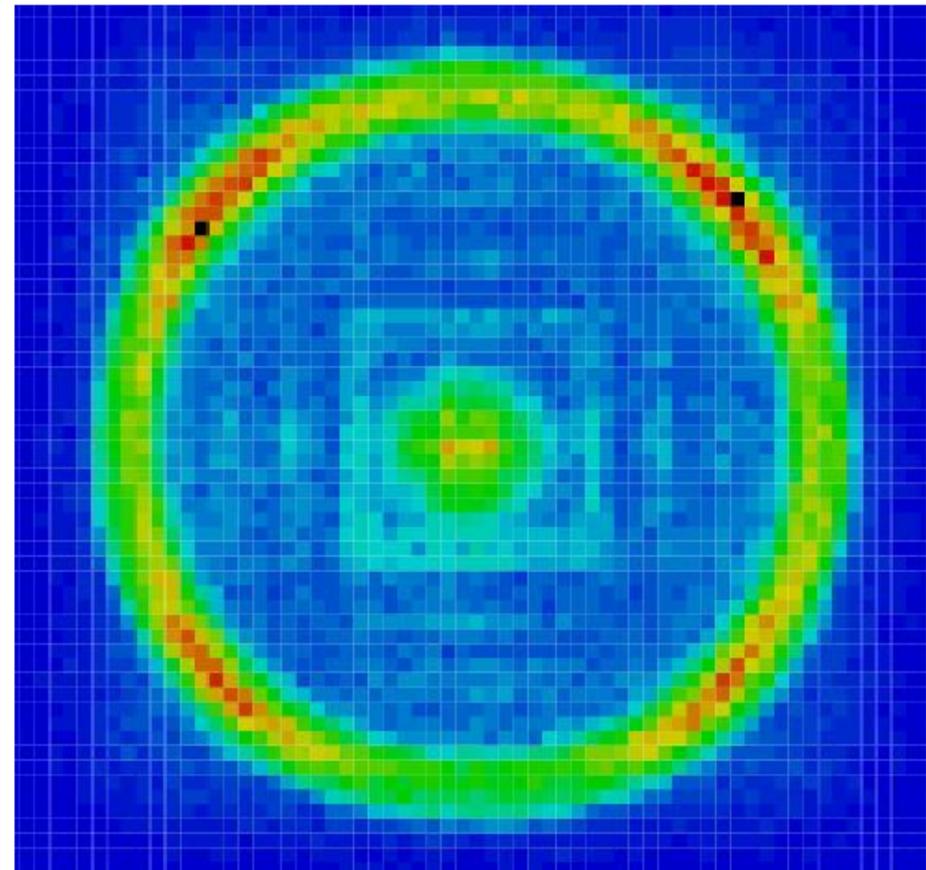

- module was moved to 9 positions to cover the ring area
- these plots show only superposition of 8 positions (central position is not included)

w/o light guides

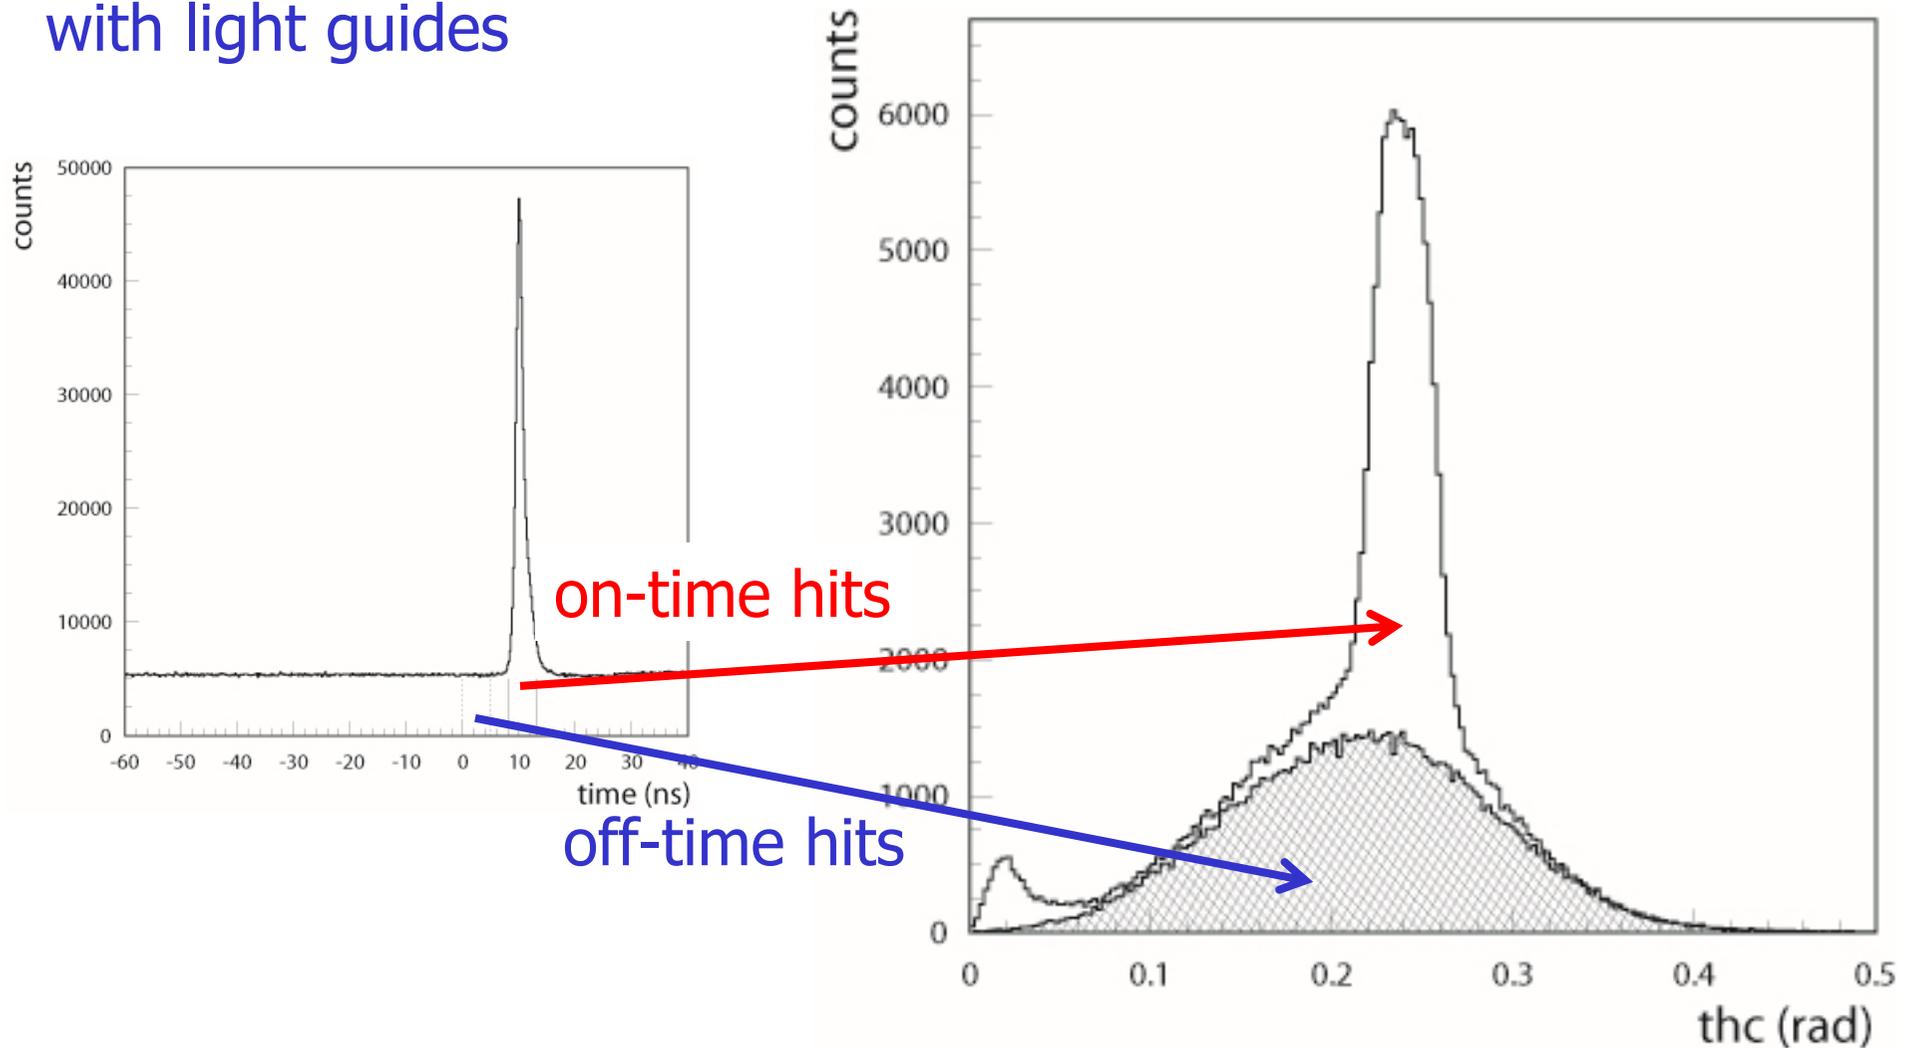

w/ light guides

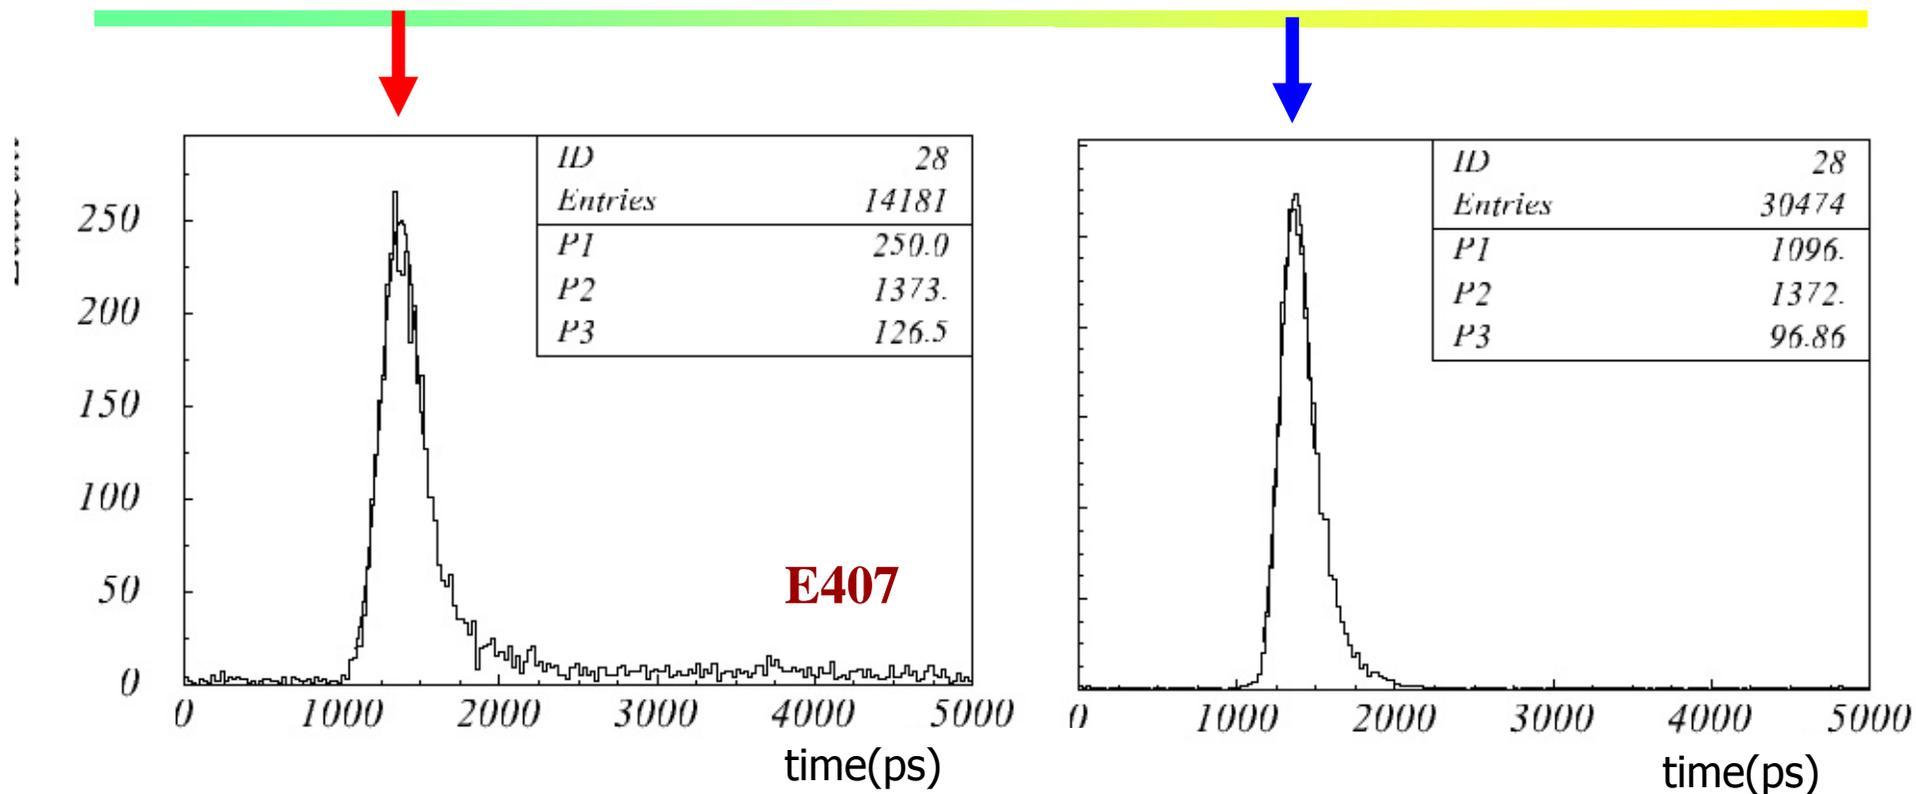

SiPM beam test: Cherenkov angle distributions

with light guides

Time resolution: blue vs red

	E407	S137	H100C	H050C	H025C
σ_{red} (ps)	127	182	145	212	154
σ_{blue} (ps)	97	151	136	358	135

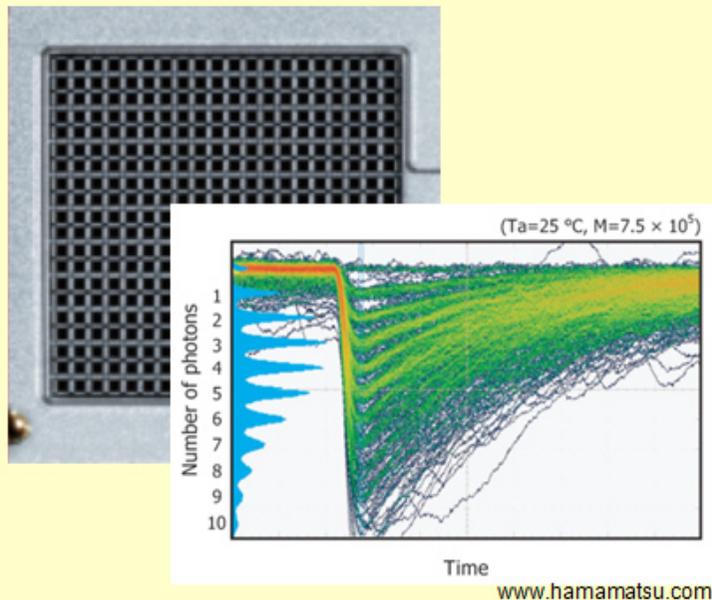

• $\sigma \approx 100$ ps

• $\sigma_{\text{red}} > \sigma_{\text{blue}}$

New player: digital dSiPM

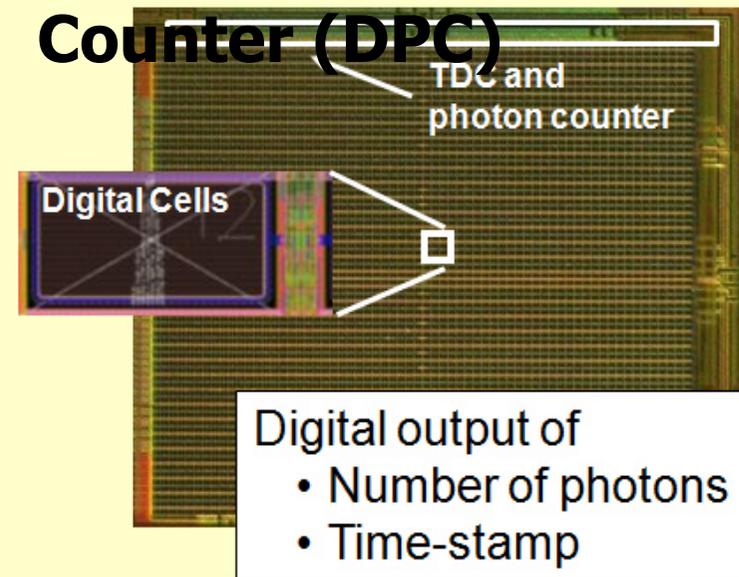

DPC: Front-end Digitization by Integration of SPAD & CMOS Electronics

analog SiPM

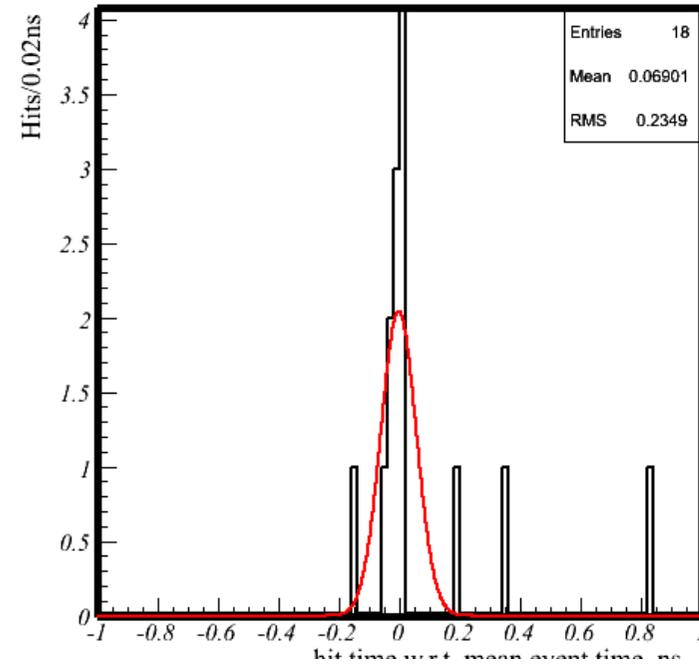

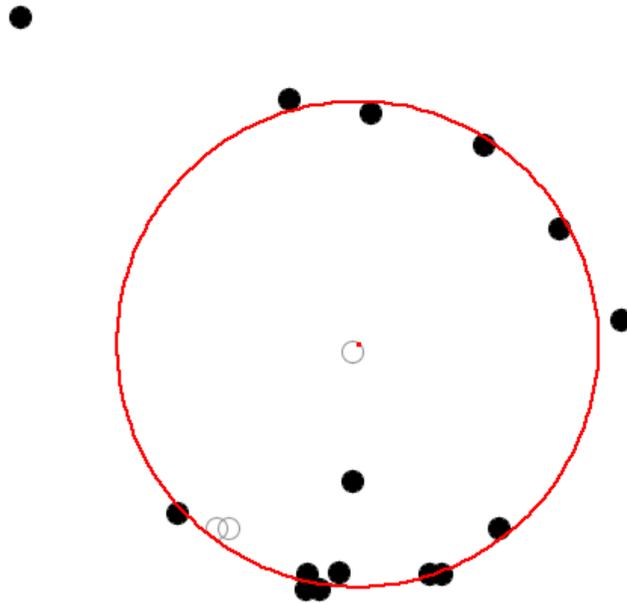

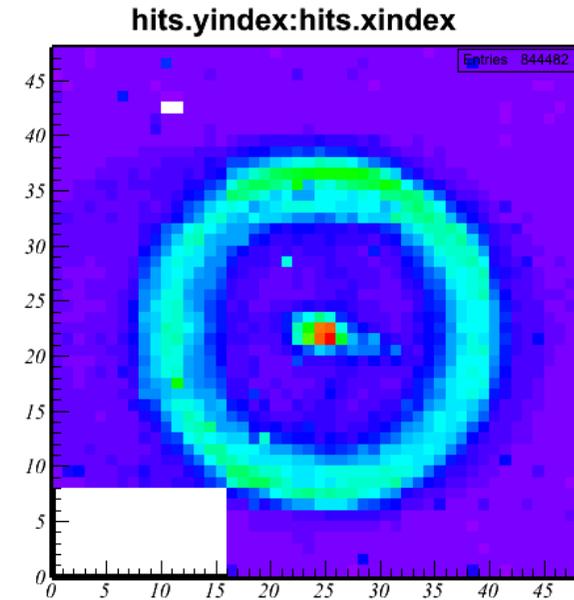

Summing all cell outputs leads to an analog output signal and limited performance

Digital Photon Counter (DPC)

Integrated readout electronics is the key element to superior detector performance

dSiPM in beam tests

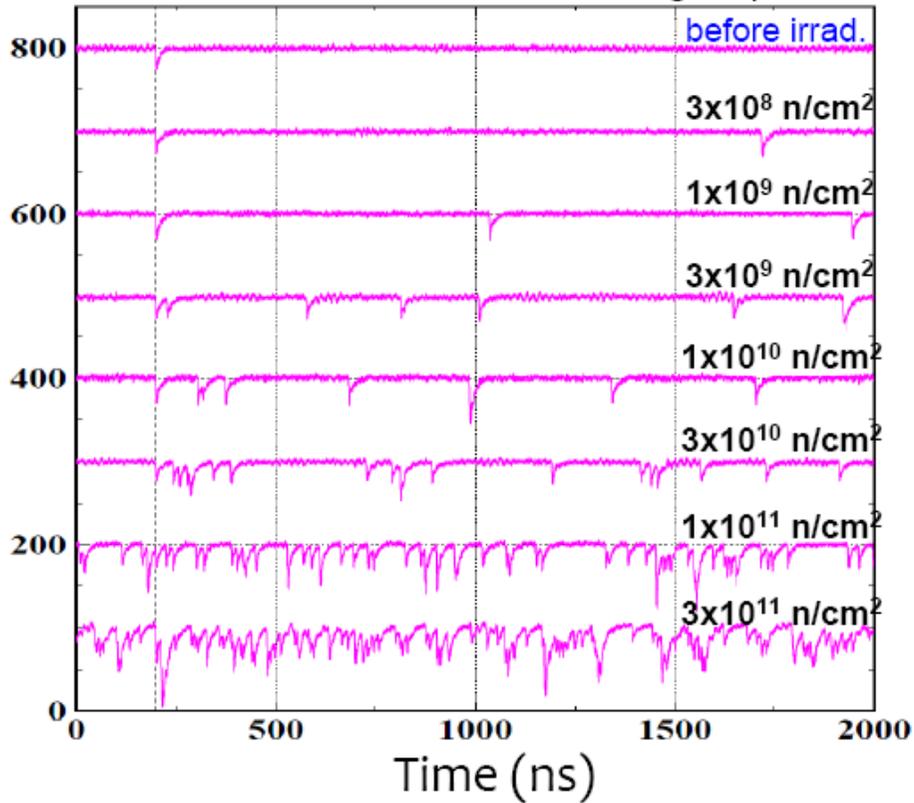

Sergey Kononov

VCI 2013

ana

Radiation damage

I.Nakamura, JPS meeting, Sep. 2008

Expected fluence at 50/ab at Belle II: $2-20 \cdot 10^{11} \text{ n cm}^{-2}$
→ Worst than the lowest line

→ Very hard to use present SiPMs as single photon detectors in many applications (including Belle II) because of radiation damage by neutrons

→ Also: could only be used with a sophisticated electronics – wave-form sampling

Summary

- Single photon detection is at the hearth of the RICH detectors
- New methods require very fast timing in radiation harsh environments
- A number of new detectors has been developed recently to cope with these requirements
- **A very active field!**
- My talk can only be seen as a warming up – there will be several very interesting presentation on recent results!
